Checkmark

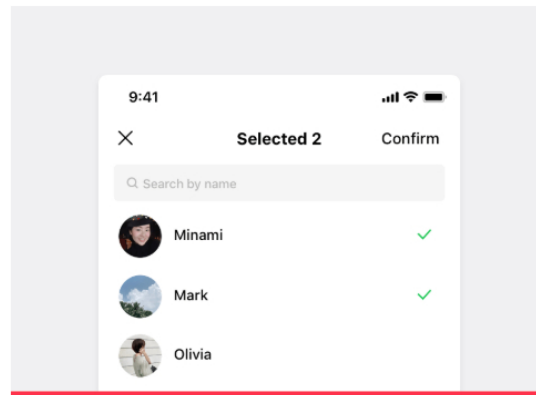

Checkmarks are used for the purpose of indicating an item selected from a list, and only single-selection is possible.

Anatomy

1. Checkmark

This is a check icon displayed on the selected item. Selected and unselected states can be distinguished by the existence of checkmarks.

Don't

It is recommended to use a checkbox rather than checkmark when selecting multiple options. Use a checkmark for single-selection options.

States

Selected

Service name
Description

The item is selected.

Unselected

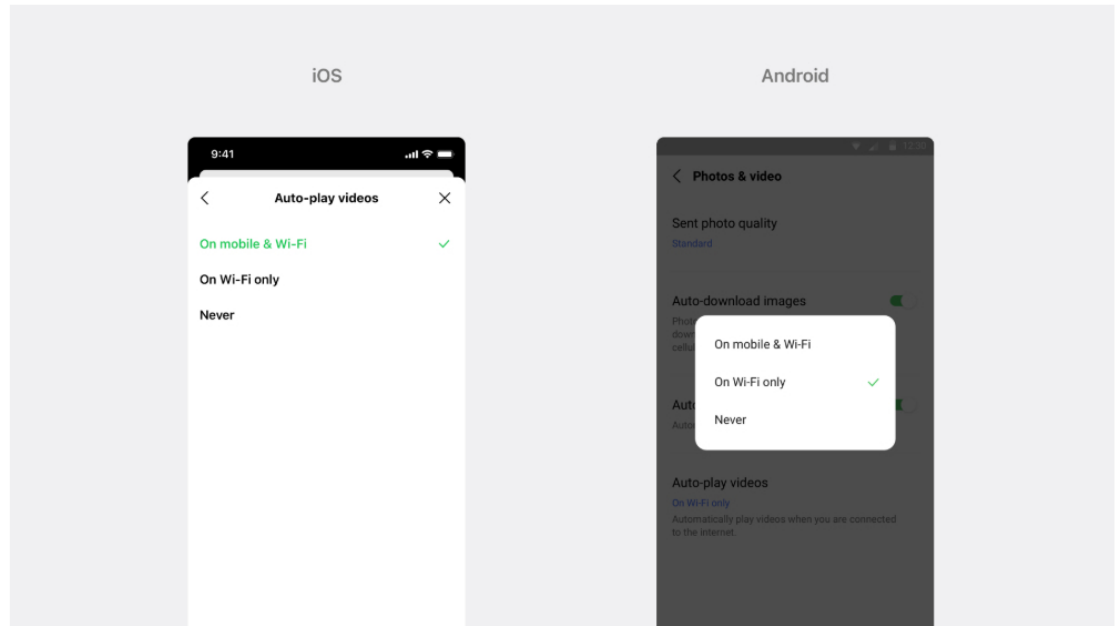

Service name
Description

The item is selected.

Usage

Settings

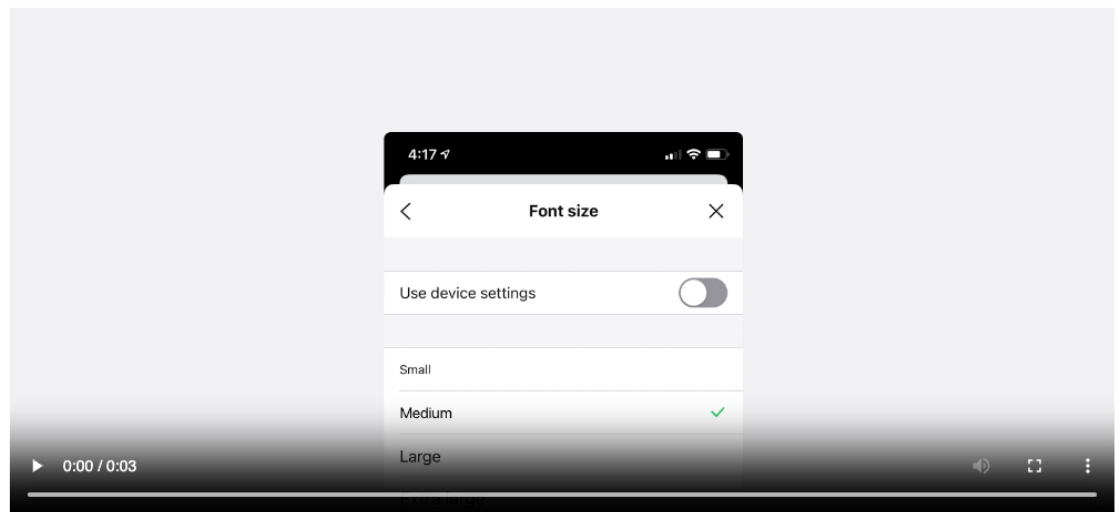

Used as shown above in the Settings option.

Actions

Checkmark is a component used for selecting one from many options. In most cases, the already selected checkmark is indicated as the default value during the first entry. If the user chooses to change the option, a checkmark will be exposed to this option and the existing checkmark will be removed.

Lists

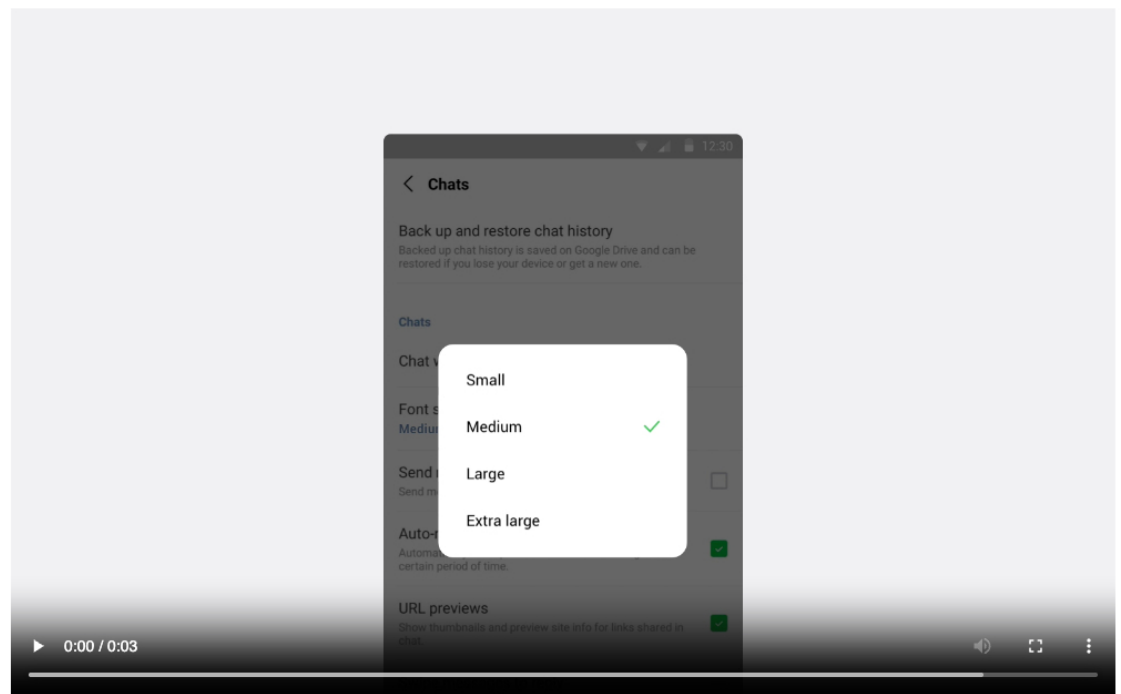

- Checkmark does not require a separate Confirm button because the value is activated right away when an item is selected.
- Use radio control if the confirmation procedure is required along with a Confirmation button.

Radio Button

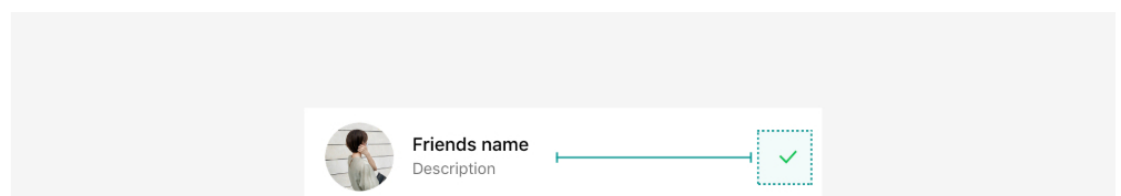

Further details regarding Radio Button are available on Radio Button.

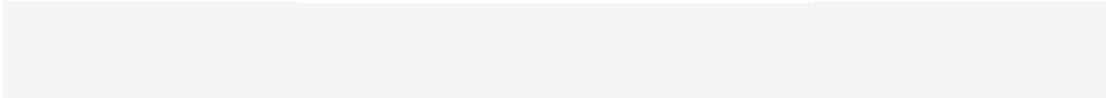

Popup

- If an option is selected using a checkmark in a pop-up window, a separate Confirm button is not required, just like on a page.
- If a selected option is changed by tapping an item in a pop-up window, the changed value will be shown instantly and the pop-up window will be closed automatically.

Placement

Checkmarks are used on the LINE Messenger list in most cases, and placed to the right of each item.
