Design Principle

LINE's products are designed using common values and design principles.

WE ≠ USERS

As designers, we are not the main target of our designs.

LINE is used all around the globe. If we assume all users share our own perspectives, we could deliver misguided results. Each challenge brings its own set of usage patterns and expectations. Even if we consider ourselves experts, we need to investigate what the users actually need.

Clear primary tasks

Make primary tasks intuitive.

Users do not gauge LINE on aesthetics alone. They actually perform a multitude of important tasks while using our products. We should design primary tasks so they can use our services intuitively without overthinking.

Chat comes first

LINE's first priority is to enable conversations between people.

The experience of sharing chat messages with those closest to you is at the core of LINE's values. New features should be designed to reinforce this experience.

Reliable design

Pursue trustworthy design.

LINE's aesthetic standards include a pursuit of design that is intuitive for all ages across a multitude of use cases.

A cohesive experience

Strive to provide a singular, consistent experience.

The user experience is not confined to a single screen. Users experience LINE as they move back and forth between screens to perform their desired tasks. We aim for a seamless flow between screens that considers the context of each screen and the relationship between them.

Respect for legacy

Respect what's already there.

Our users may be using our service in unexpected ways, or feel familiarity for the existing UX. Even if changes to an existing feature have

a clear benefit, we should take care to phase them in appropriately.
