Flex Message

Flex Message

Component to send an informative message to chatrooms with a combination of texts, images, lists and buttons.

Anatomy

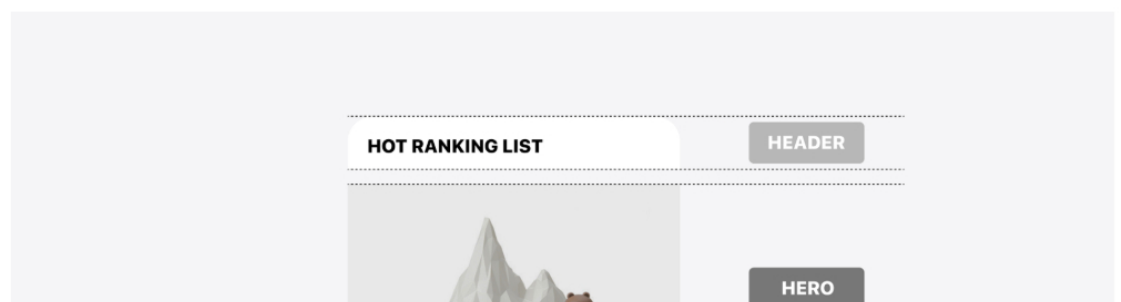

1. Message bubble container

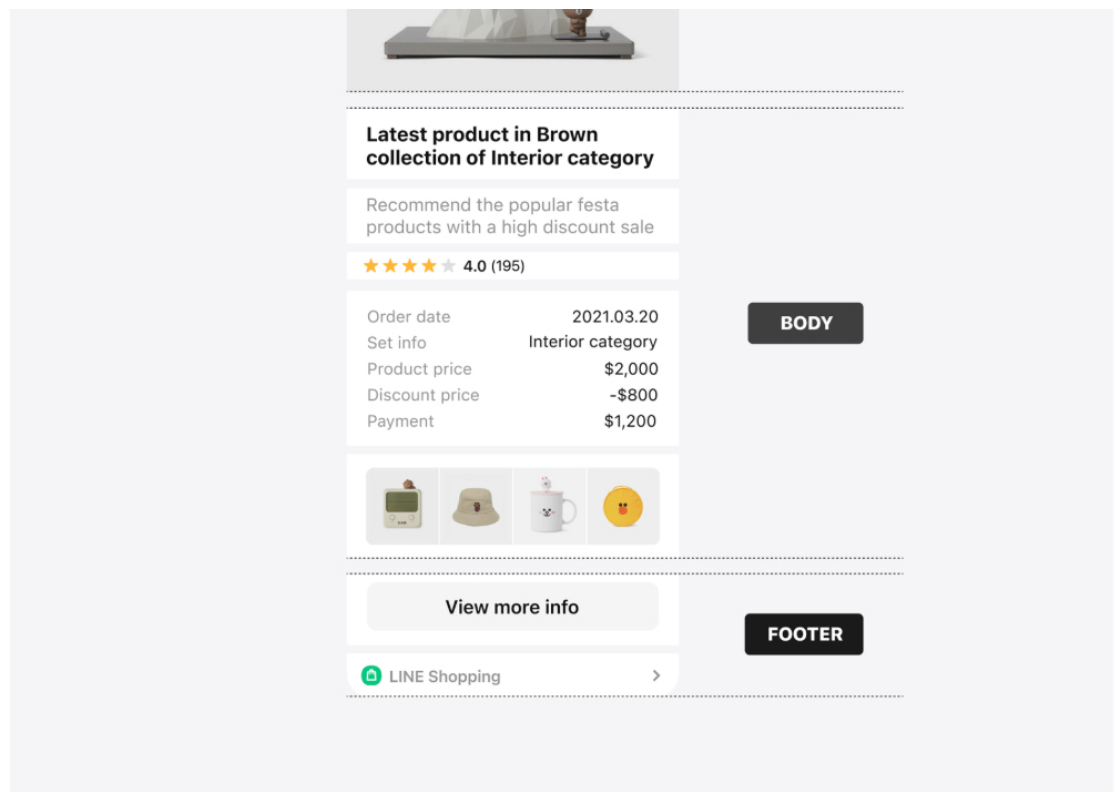

Form and background enclosing message contents.

2. Message contents

Composed of various components including texts, lists, images and buttons.

Structure

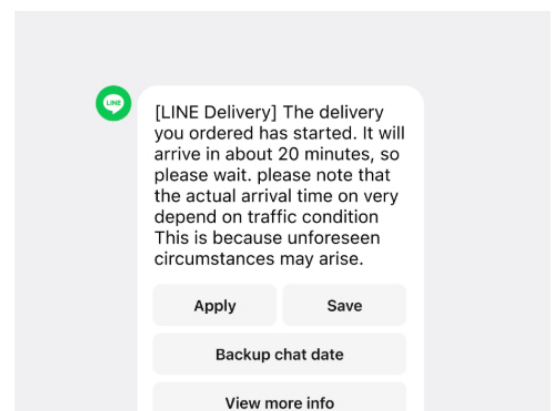

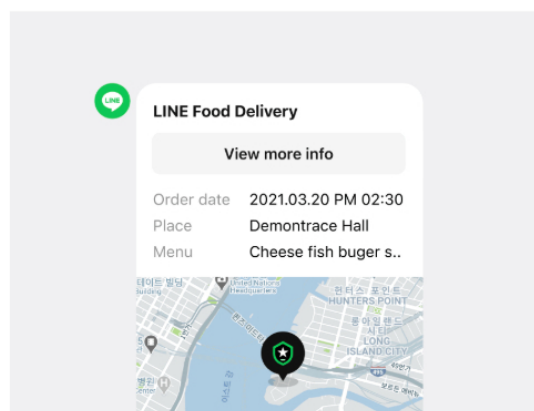

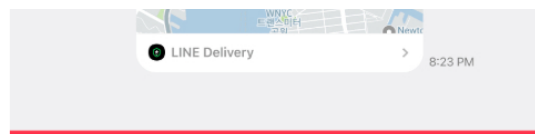

- Flex message is structured in blocks.
- The order of blocks is Header → Hero → Body → Footer.
- It is not mandatory to include all blocks. For example, if Header is not necessary, it can be arranged from Hero → Body → Footer.
- Each block can include various component modules. Within the same block, modules can be arranged freely. However, the order of blocks cannot be changed.
- You can view a range of modules for each block in LDS Template.

Header	Text can be used for a message title. You can add a badge at the right corner.
Media (Hero)	An image or video can be added as well. It is effective to use an image or video directly delivering the purpose of the message as this section in the bubble is at the center of attention. It can be set up to move to the main page of a service when this section is selected.
Body	You can design this section with modules such as texts, lists, caption or image box in line with the intention and purpose of the message.
Footer	You can add an action button or link label. Users can read the information at the top section and immediately take an action or move to the main page for more information.

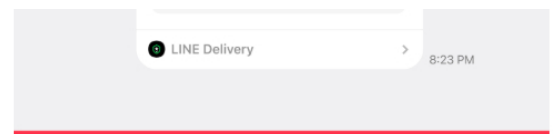

Do & Don't

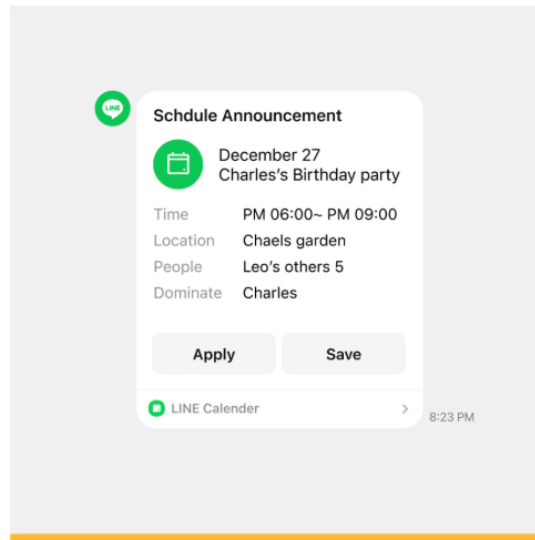

Don't

You cannot arbitrarily change the order of blocks.

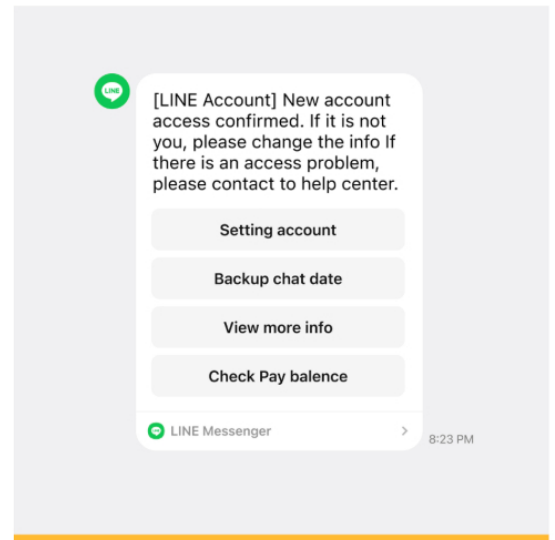

Don't

Horizontal position and vertical position cannot be mixed for buttons.

Caution

When placing buttons horizontally, you need to consider the length of a label in a button or multilingual version. Ellipsis or two lines must not be used.

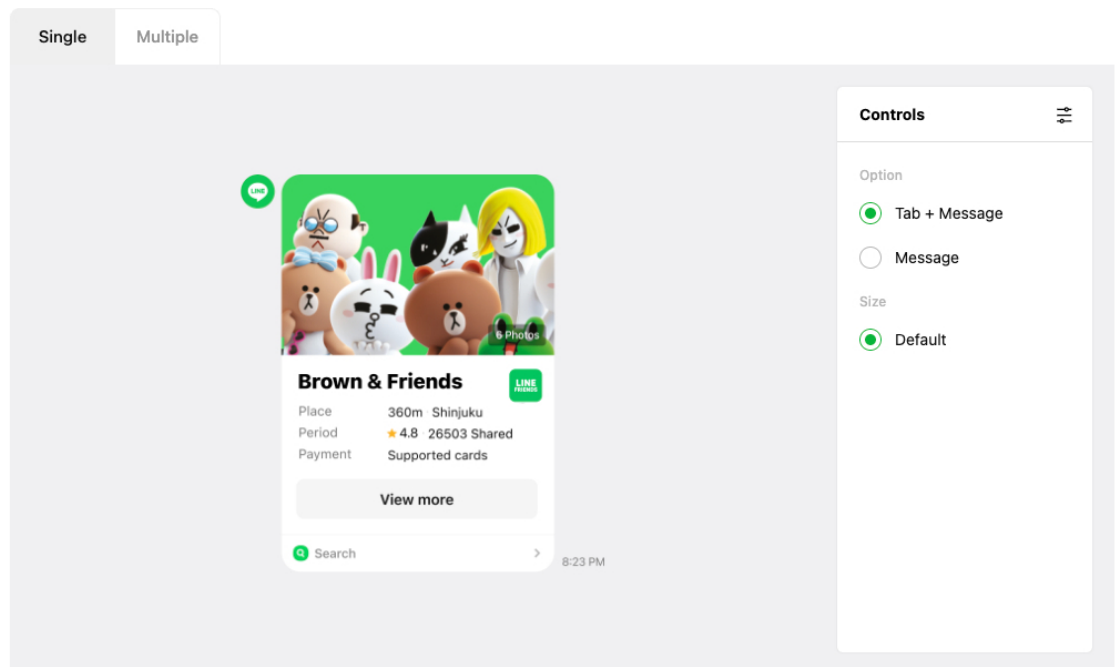

Caution

You could cause confusions for users if there are too many buttons to select. It is not recommended to provide too many buttons as there could be multiple links within a bubble.

Types

Type is determined by the number of flex messages. Consult and request a new type of specifications.

Single

- Type with a single bubble.
- You can design a flex message by combining various modules to meet your requirements.

Multiple (Carousel)

- You can add two or more bubbles horizontally. Users can swipe bubbles left and right to browse messages.
- Multiple type is recommended for using multiple bubbles with relatively simple information. When offering a carousel type of messages in a chatroom, all bubbles are not visible at once and users need to engage to browse through bubbles. You need to select options in consideration of these characteristics.
