Icon Guideline

LINE icons are the most efficient way to deliver ideas and objects to users. You can find out how to apply and create icons for LINE services here.

Icongraphy Application Guide

Icon Category & Type

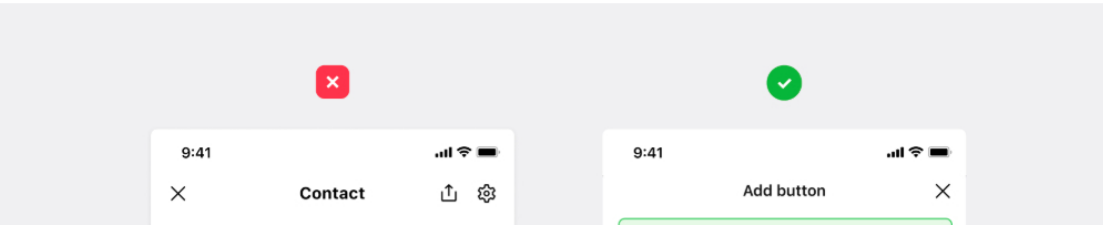

You can change various options of the component to customize the specification to meet your needs.

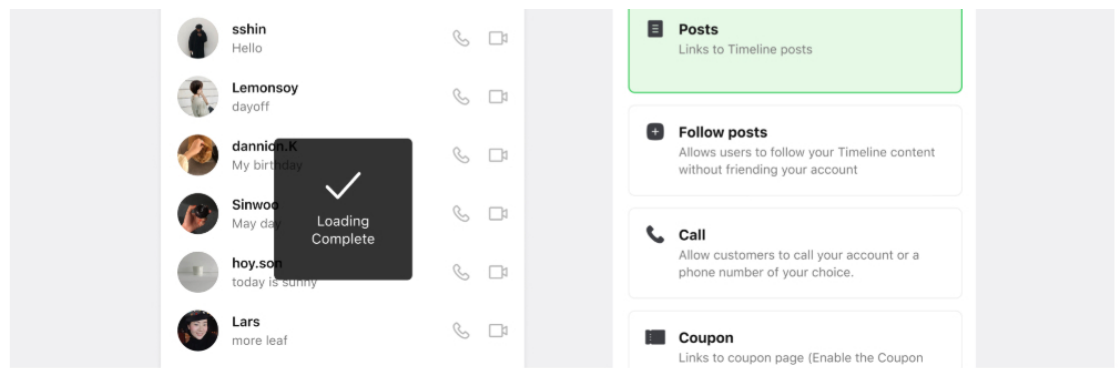

CATEGORY	PURPOSE OF USE
Common	Show the information and features linked to icon metaphor throughout various components and products and aim to improve the usability by using a single icon for same or similar features and information.
Brand	Icons to represent relevant features and information for individual LINE brands or services.
ETC	Icons to represent features and information related to external services.

Icon Usage

Icon customization is limited to changing sizes, and metaphor or style changes are not allowed.

USAGE CUSTOM GUIDE

Using a component section

- Icon size and stroke are fixed for each component section, and no customization is allowed. If you need to add a new icon, you can consult the relevant team and follow the Create & Contribution Process to create new icons.

- You can also contact the relevant team to add icons if what you need is included in the LDSM Icon Library but not in the component section.

Using a custom design section

- Recommended stroke widths are 1.3 / 1.5 / 1.8pt. You can choose one of these stroke widths to apply to icons of your choice.

- Use the scale feature in LDSM Icon Library's design tool (Figma) to increase the size, and its stroke width will be proportionally changed. You can apply the automatically adjusted width.

Iconography Creation Guide

Icon Create & Contribution Process

If you don't find an icon you need, you can create a new icon, following the Create & Contribution process.

STEP GUIDE

STEP 1

- Check if what you're looking for is in the LDS Icon Table first. If not, create your own icon.
- You should ask the relevant team to review if this icon is for a feature or metaphor commonly used in LINE Messenger, and start the process to add it to the library.
- If this icon can be used just once for an individual product, it might not be added to the LDS Library.
- It is not allowed to produce and apply a redundant icon only to change the design style.

STEP 2

- Follow the guide below to create a set of 8 types.
- Refer to LDSM Template_Iconography for specifications.

STEP 3

- Share new icons with the LDS Icon manager so that they can be added to the LDS Icon Library.
- If you created an icon for the Common component, you need to send a screen file with the design test of the new icon added to the component.

Style

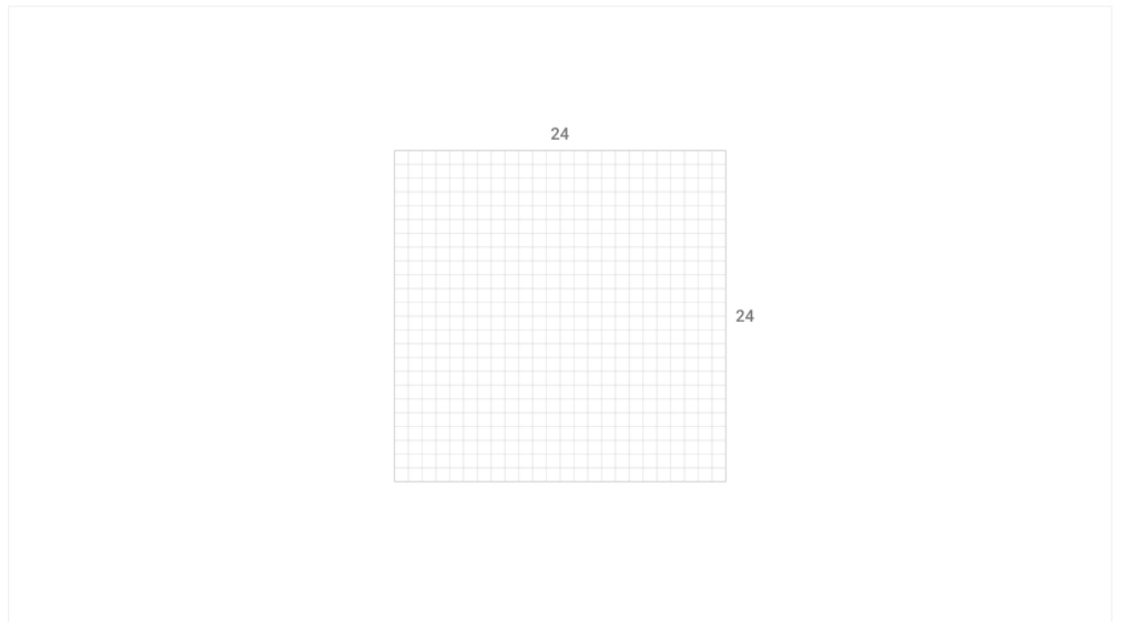

LINE icons are designed to be concise, consistent and neutral. They are characterized by fat strokes and round corners.

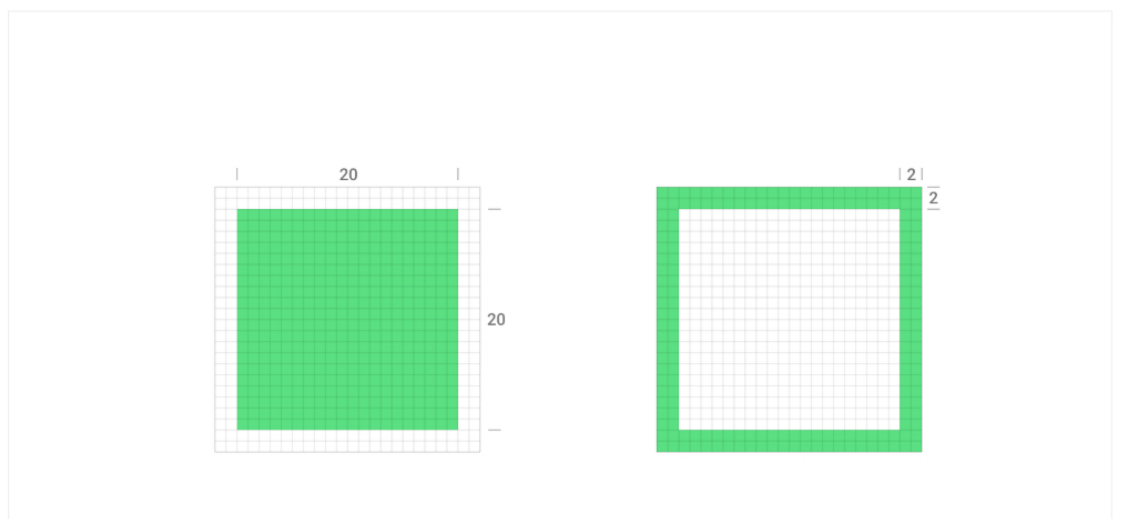

Grid

Default grid is 24 x 24 px, but it can be adjusted for your need.

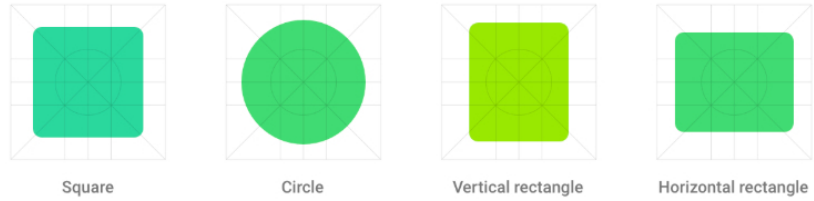

Padding

Grid includes the padding of 2 px in all sides. Icons should be drawn within an area excluding the padding.

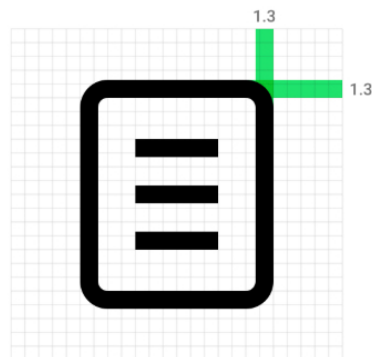

Key shape

Key Shape determines the basic frame of each icon. Consistency can be added to icons with a similar ratio.

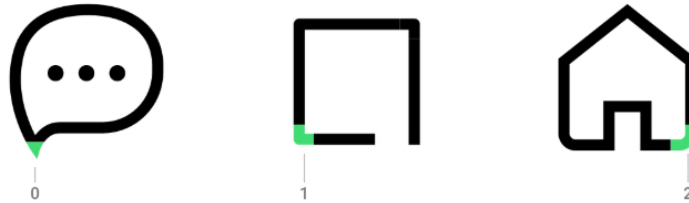

Stroke

Default stroke is 1.3 pt, and it can be changed based on the size, position and purpose of each icon. It is recommended to design your icon so that the outline of stroke coincide with the pixel.

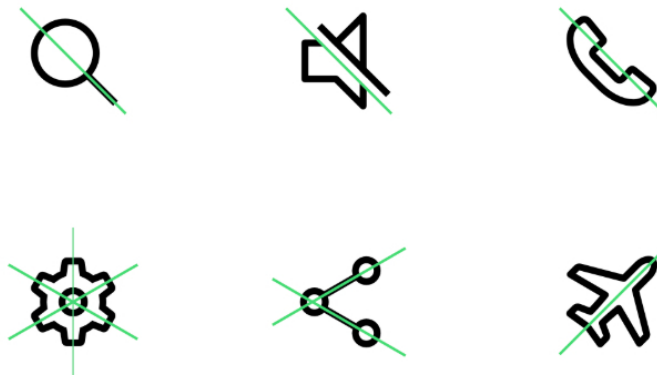

Radius

Radius can be chosen between 0 and 2 px. It is used for more effect on the motif, and it can be individually applied to each corner.

Angle

Angle is generally applied as 45 degrees, but you can also apply in 15 degrees, if necessary.

Build

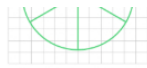

This is how you create an icon.

1. Define an object or a concept to be used as a metaphor representing the feature and purpose of the icon.
2. Determine the grid, key shape and angle in consideration of the position and size of the icon.
3. Add or remove an object to create an overall shape.
4. Make final adjustments with stroke or radius in line with the screen where the icon will be used.
