Iconography

The LINE Design System Icon are synchronized with the LAICON (LINE Atomic Icon). In designs using the LINE Design System Icon Library, LAICON codes may be used to display icons.

Icons designed according to the rules can be used for other services after they are registered to the LINE Design System/LAICON. To use icons that are not included in the LINE Design System Icon Library, you can create and upload (contribute) new icons to the LINE Design System/LAICON.

Icon Naming Convention

There are three icon categories, and each category has two types. Names are created according to the category, type, and the icon name.

1. Category

	Category	Description
1	Pictogram	- Icons that are used as UI elements. - e.g. Arrow, Coupon
2	Brand	- LINE's brand icons. - A BX review is required when an external service is used. - e.g. LINE Music, LINE Messenger
3	Private	- Third party service icons. - They are generally used for internal services. - e.g. Microsoft Excel, Adobe Photoshop

2. Shape

	Shape	Description
1	Regular	• Outlined icons.
2	Solid	• Icons filled (Contained) with colors.

3. Icon Name

- Use nouns instead of verbs for icon names.
 - e.g. *Close* → *Times*
- For the same icons in different types, add '-alt' at the end of the name.
 - e.g. *chat-alt*

Icon Design

When designing and contributing new icons, the following design guidelines must be observed.

Grid

The default grid size must be 24x24px.

Padding

A grid must have 2px paddings at the top, bottom, and on sides. Icons must be designed in the area excluding the paddings.

Key Shape

Key shapes define the default format of icons. You can design icons with similar ratios in a consistent way.

Stroke

The default stroke is 1.3pt. The stroke may be changed according to the size, location, and purpose of the icon. It is recommended to design your icons so the stroke outlines match the pixels.

Radius

The radius may be freely adjusted between 0 to 2px. Radii are used to express the motive of icons more effectively and they can be applied to each corner individually.

Angle

An angle of 45 degrees is generally used, and other angles in multiples of 15 degrees may be used if needed.

Build

The process of icon building is as follows:

1. Define an object or a concept that will be implied by the icon.
2. Specify the Grid, Key Shape, and Angle according to the location and size of the icon.
3. Add or remove objects to create the outline.
4. Adjust the details, such as the Stroke and Radius, considering the screen where the icon will be placed.
