LINE New Design

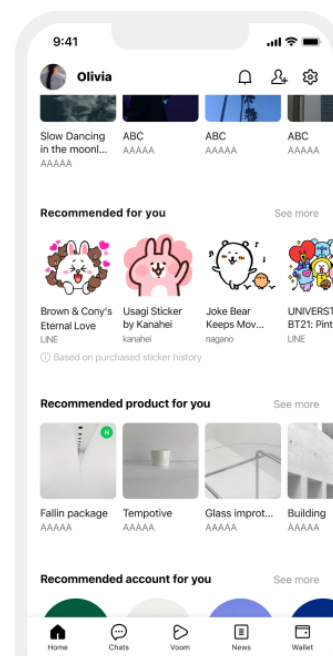

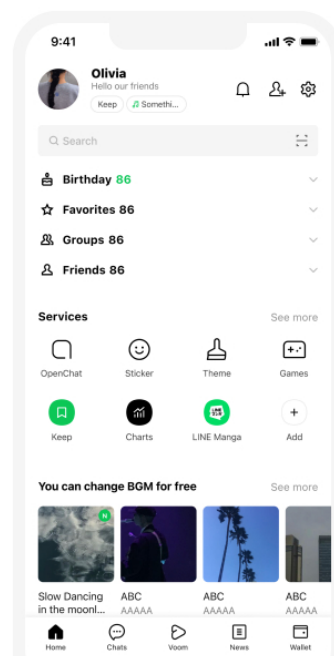

Introducing a case of applying LDS components to LINE New Design.

LINE New Design is a design renewal project based on the LDS (LINE Design System) and a representative case of fully applying LDS components. Previously, the LINE app UI was somewhat fragmented, but LDS common components contributed to applying UI consistently throughout the LINE app. As a result, the LINE app now looks more simple and light. Let's take a look how LDS components were used in the main page of the LINE app.

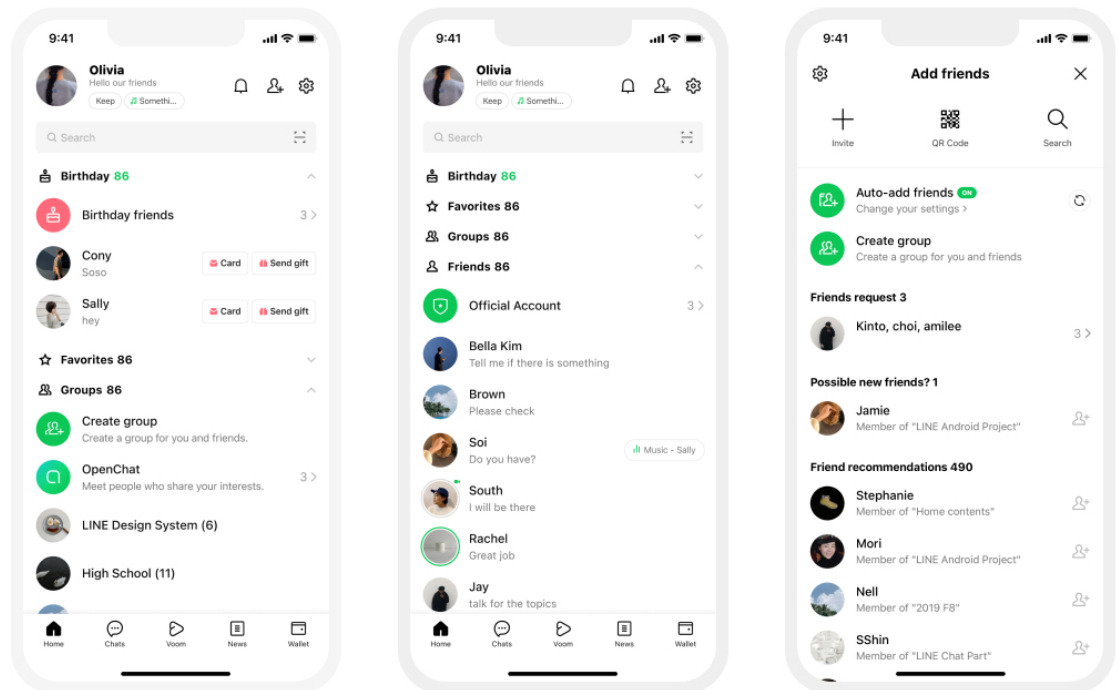

Home tab

In the LINE app, the Home tab serves as a dashboard with the personal information and friend list of the user and gates to various services of LINE. User profile is positioned in the top bar to maximize the use of the center space, catching the attention of users, and secure sufficient space for content in the center. Card components are used for service recommendations and content customized for each user.

Friend list uses List and List Header components. List Header supports various actions such as move, filter or drop-down based on the composition of the right button.

Card

A card is a component which includes the content and actions of a single item.

List

A list means a group of vertically aligned items as a collection of text and text/image combinations.

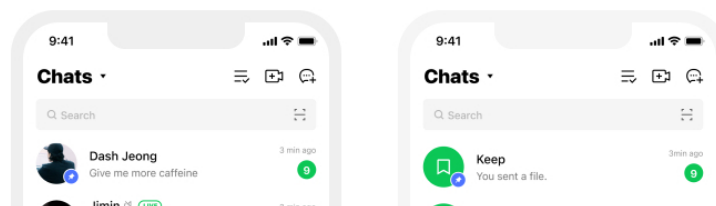

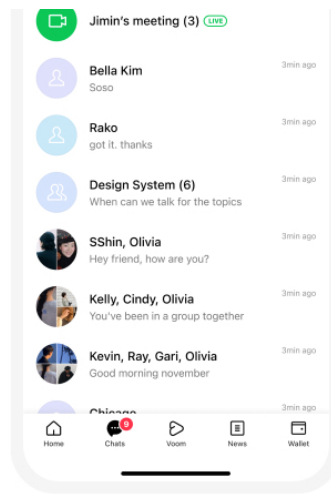

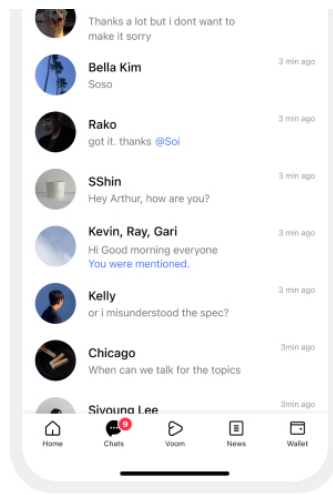

List Header

A list header represents the list section. Place at the top of a group configured as a list.

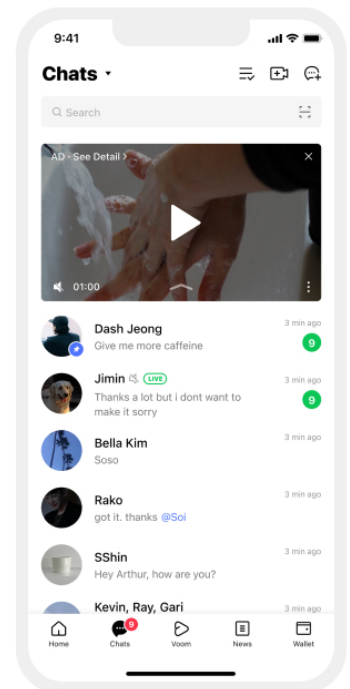

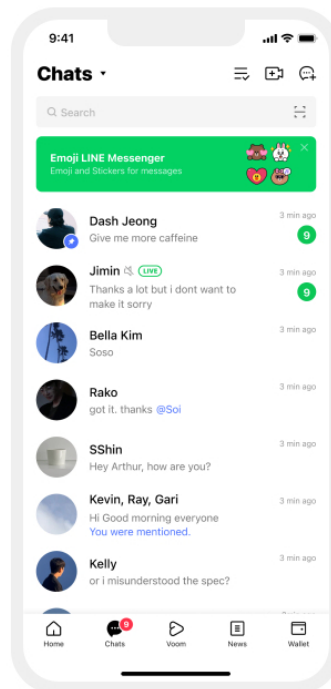

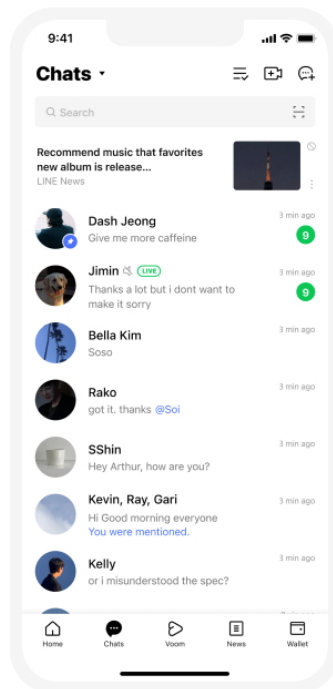

Chat tab

Chat tab is the most frequently visited page by users in the LINE app. This page is mainly composed of List components of the LDS. Users can identify a chatroom with Profile components on the left. Profile component indicates whether each chatroom is 1:1 chatroom or group chatroom. Badge on the right notifies users of a new message.

At the top of the Chat tab, Banner component is placed to display important notices, promotions or advertisements. You can use eye-catching images or messages to maximize the effect. But, at the same time, you need to ensure banners do not steal the attention of users to chatrooms and badges. The close button is provided at the top right for users to close the banner.

List

A list means a group of vertically aligned items as a collection of text and text/image combinations.

Profile

Profile in LINE Design System signifies the circular component, which represents the user on a screen.

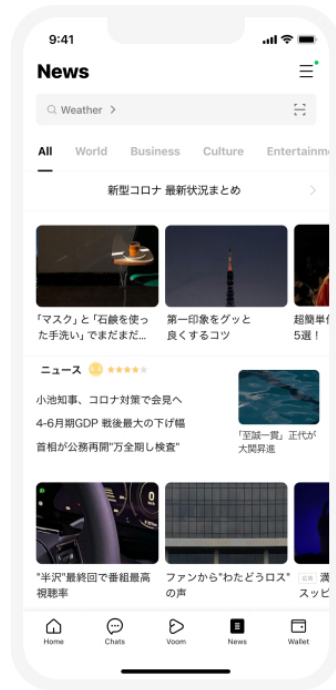

Banner

The banner is used as a guiding role by indicating brief, important messages for certain functions or updated services.

News tab

News tab provides various contents in real time including news, weather or fortune-telling. The top bar of this tab includes common LDS components, namely Top Navigation and Search Bar. Tab component is used below to group news contents by categories. As abundant information is provided in an organized way, this enables users to easily browse and access their favorite content.

Top Navigation

Top Navigation shows the title of the screen where the user is remaining and key action buttons.

Search Bar

Users can use the search bar to quickly find the information provided by the app. "Search bar" refers to a field component for entering a search query.

Tabs

Tabs are used to organize content by grouping similar information within a page.

LINE New Design is still ON!

LINE New Design is still on-going. As shared above, users in many countries are already experiencing various LDS components on the main page. We plan to apply LDS to remaining sub-pages through a design renewal. We look forward to your continued interest in the ever-evolving LINE app and New Design.

Designer Comments

“ It helped to effectively save time during design QA as many elements have been standardized into components. ”

Given the characteristics of the New Design project, UI appears similar but buttons or icons are often different in terms of small details. I think LDS components contribute to maintaining consistent usage and look of the design for each page. In addition, as many elements have been standardized into components, it helped to effectively save time during design QA. Yet, there are still some elements that are not embedded in development components due to various issues. Going forward, the focus should be integrating design and development.

Designer Jimin Huh

“ New Design project was a good opportunity to check if components can be applied without an issue from various angles. ”

LINE Design System has been built from the foundation to components so that it can be applied to any case, reinforcing consistency and quality. The New Design project was a chance to test overall LINE Design System whether its components can be used across areas. The New Design project opened the door to other opportunities for the LINE Design System and I'm confident more products benefit from the LDS.

Designer Sinwoo Yu

“ Sometimes it's difficult to decide 'which design is more like LINE'. And, it helped a lot to take a look at sample pages in the LDS. ”

It was also quick to apply as main components of the existing pages are compiled and organized in the LINE Design system. When designing a new page or adding a new element, it's difficult to decide 'which design makes it more LINE'. So, I refer to the design of other pages in the LDS before I make a decision.

Designer Minji Chung

“ As the LDS sets standard, it was easier and more smooth to conduct QA and communicate with other members. ”

I was responsible for VOC in New Design to get the feedback of design QA and users. QA was conducted with clear set of standards and communications between members were easier and more smooth all thanks to the LDS. It was positive experience for me as I directly witnessed user reaction to New Design during the VOC process and reflected those feedback to make improvements.

Designer Yaeji Kang

“ It was convenient to update relevant pages at once without individually searching components for each page. ”

With the LINE Design System, I was able to update relevant pages at once without individually searching components for each page. Development team also proactively maintained and updated the LDS guide. As the LDS is being used in various LINE services, it would be great if LDS components offer a wider range of design choices. I cheer for the LDS to continue to evolve and get completed.
