LINE OpenChat

Introducing a case study of OpenChat with LDS components

LINE OpenChat is a service for users who share a common interest to discuss and exchange information in real time. LINE OpenChat was first launched in 2019. As of January 2022, there are about 12.5 million OpenChat users. As Openchat is a chatroom-based service, it is designed to maintain the usability of existing 1:1 chats or group chats so that users find it easy to use. This is how LINE Design System was applied to OpenChat.

Chatroom

OpenChat uses the same top navigation and chatroom component of LINE's 1:1 chat and group chat for the purpose of keeping its design consistent with LINE. OpenChat badge appears at the top navigation, and its cover image is used as a background for users to immediately realize which chatroom it is.

Top navigation

Top Navigation shows the title of the screen where the user is remaining and key action buttons.

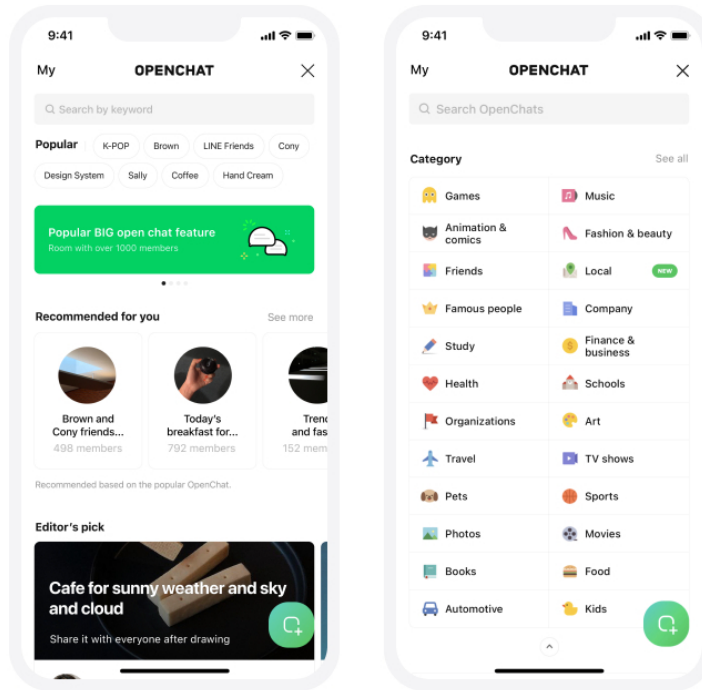

Flex Message

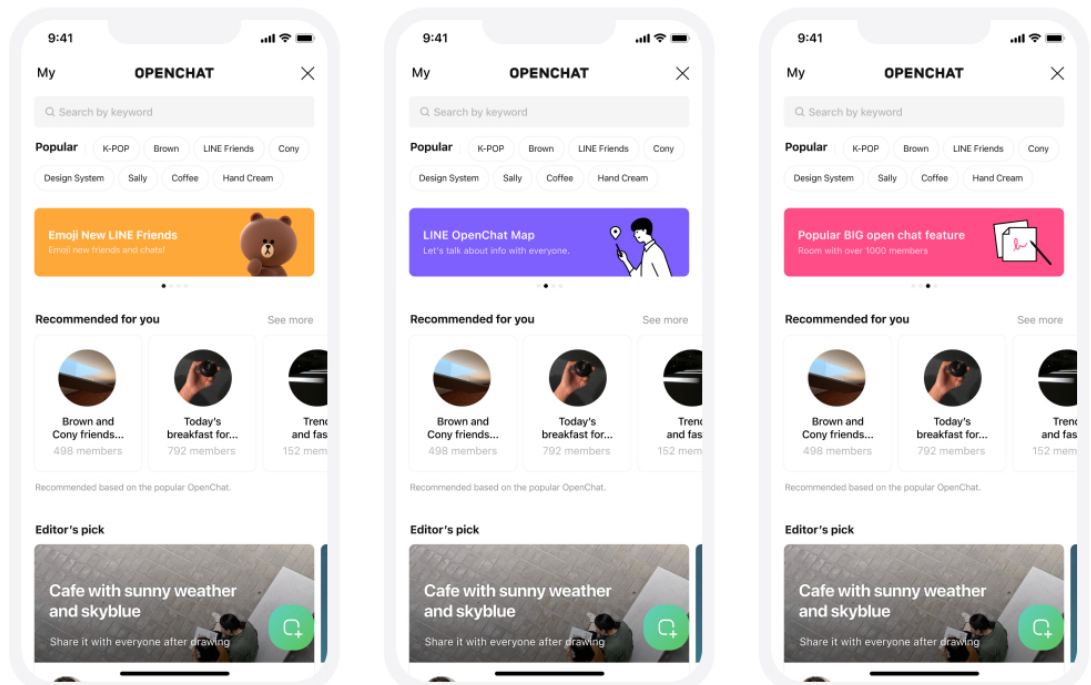

Component to send an informative message to chatrooms with a combination of texts, images, lists and buttons.

Main

The main page and cover page are the first gateway to OpenChat for users, and we used the full-screen modal view of the LIFF browser for these pages. It is recommended to use the full-screen type modal view to get the attention of users. Unlike normal view, users need to finish the task on the modal window or close the modal to return to the original page. This is why 'X' button is provided on most of the top navigation, and the positioning of buttons rely on the type of tasks on the modal.

At the top of OpenChat, the banner component is used to display a key notice or a promotion for users. In OpenChat service, we show popular OpenChat chatrooms and OpenChat chatrooms that could interest users.

Modal view

Using modality, you can provide a clearer workflow through the interaction between the floating screen and the screen below.

Banner

The banner is used as a guiding role by indicating brief, important messages for certain functions or updated services.

Create Chat

Users can create their own OpenChat based on their interest. They should enter the name, description and category in the Create Chat page. Input component was used for those fields to enter the chatroom name, description and category. Text counter is adopted to show the current text count out of the maximum number of letters for consistent usability. It is also efficient and convenient as all input fields for Create Chat are provided on a single page.

Inputs

Input is a component to enter and edit text, numbers, and symbols.

Box Button

The Box Button is the most general button in the form of a box. It is placed in the content area or the bottom area of the screen to be used as the button for executing important actions on the screen.

Designer Comments

“ I could implement the identity of OpenChat based on the design principles of LINE Design System. ”

As OpenChat service provides all pages through both browsers and native app, there were some limitations in adopting LDS components. I cross-checked against LDS components and foundation implemented in other LINE services to maintain consistency. When I needed to customize for OpenChat service, I made proposals and discussed with LINE Design System before implementation.

Designer Woori Lim

“ LDS facilitated communications with relevant teams and consequently helped to improve work efficiency. ”

In the past, it usually required many discussions and QAs with relevant teams for coordination until we could produce final output. LINE Design System reduced unnecessary communications, boosting work efficiency, and it also contributed to reinforcing quality as I was able to apply consistent UI and UX built on LINE design principles.
