LINE Semantic Colors

LINE Semantic Colors are color system with a meaning created based on the LINE Color Guide. LINE Semantic Colors ensures consistent color usage and reduces the number of design-development communication costs.

Background

Starting in 2019, iOS 13 and Android 10 have supported Dark Mode and Dark Theme. So the necessity of dealing with issues has also emerged in the LINE App.

In order to efficiently manage color between color modes, LINE App has developed its own Semantic Color like Apple and Google to cope with dark mode. (as of iOS 2019)

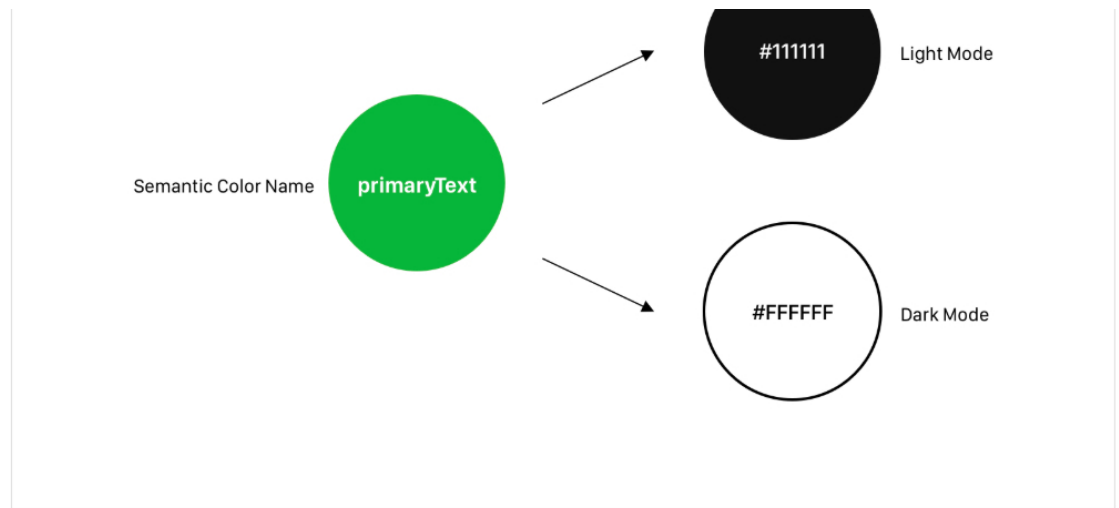

LINE Home - iOS Dark Mode

Semantic Color

Semantic Colors have specific meanings or value status.

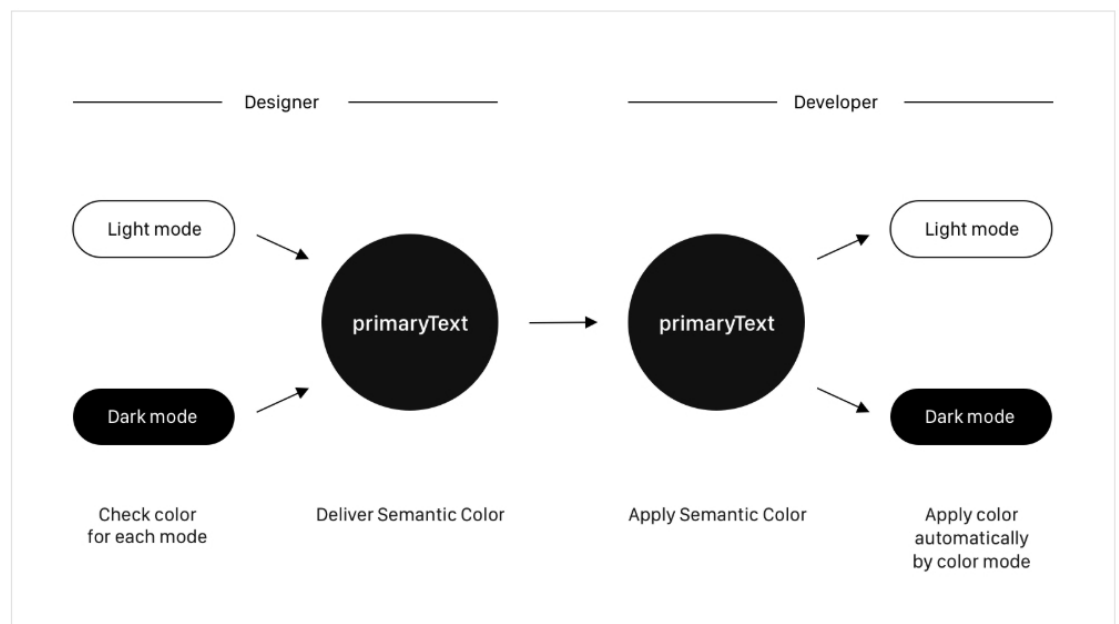

This means it can have different color values depending on the Theme or color mode.

The PrimaryText color used for the main text has a value of **#111111** which is a color in Light Mode and a value of **#FFFFFF** which is a color in Dark mode.

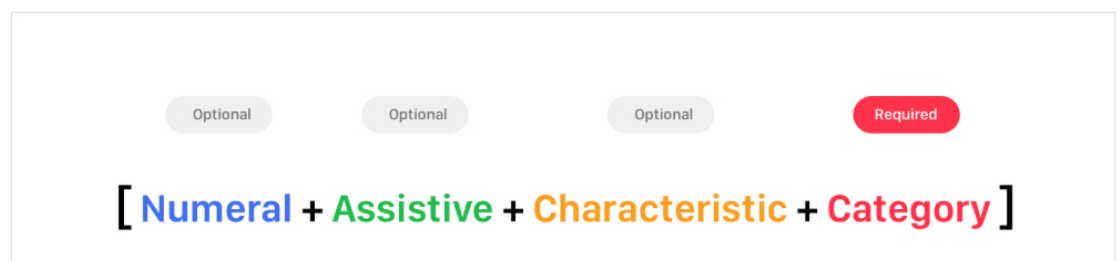

Workflow of Semantic Color

The designer checks the color for each color mode and deliver the corresponding semantic color to the developer. The developer only needs to apply this color, which will be automatically applied as different colors for each color mode based on the predefined values.

LINE Semantic Colors

Naming Structure of Semantic Colors

Primary	Alt	Accent	Text
Secondary	Sub	Placeholder	Link
Tertiary	...	Additional	Fill
Quaternary		Prominent	Surface
Quinary		Neutral	Background
...		Inverse	Separator
		...	...

Detailed naming conventions - Numeral

Follow the rules of Numeral_System when classifying within the same category.
 It is advised not to go above Quinary, which means "the fifth important."
 The order is determined by the frequency of use. (From the primary use, Primary-> Secondary->...)

Primary	primaryText
Secondary	secondaryAccentText
Tertiary	tertiaryNeutralFill
Quaternary	quaternarySeparator
Quinary	
Senary	
Septenary	
Octonary	
...	

Detailed naming conventions - Assistive

If you need to use the same color in one mode as the semantic color which has already been defined in the other mode, prefix it with "Alt" or "Sub". ('Alt' is recommended as the first choice)

quinaryText	Gray 400 / Gray 700
	equal unequal
quinaryAltText	Gray 400 / Gray 650
[Use quinaryAltText as an alternative to quinaryText.]	

Detailed naming conventions - Characteristic

Give character to the semantic color.

It can be used before the category when the color is used for a specific meaning.

Accent	Used for an emphasized object.
Placeholder	Used for a hint text.
Additional	Used for additional use.
Prominent	Used for a noticeable object.
Neutral	Used for a neutral object.
Inverse	Used for the reverse.

Detailed naming conventions - Category

Text
Link

Fill
Surface
Background

Separator
Nonadaptable (light / dark)
Disabled

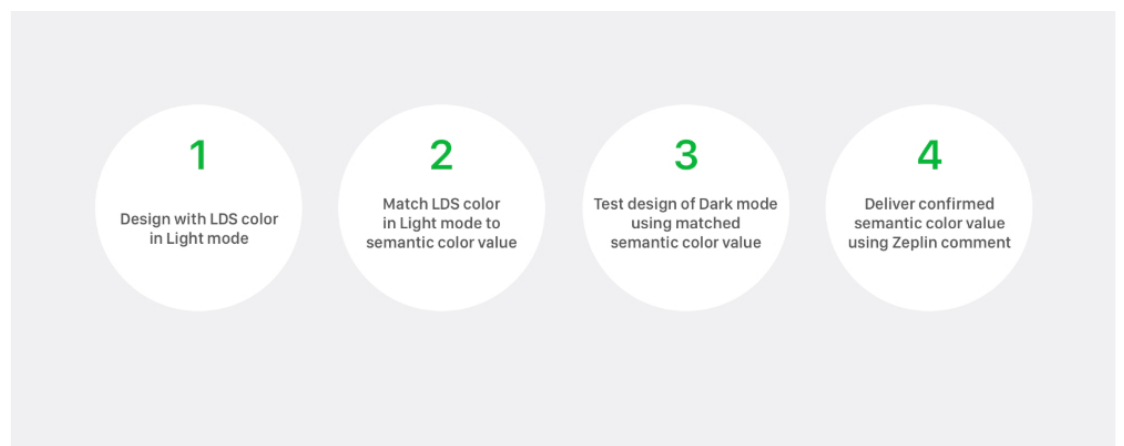

Unique (chatBubble)
Legacy

Category, but placed where **characteristic** is supposed to be due to structural reasons.

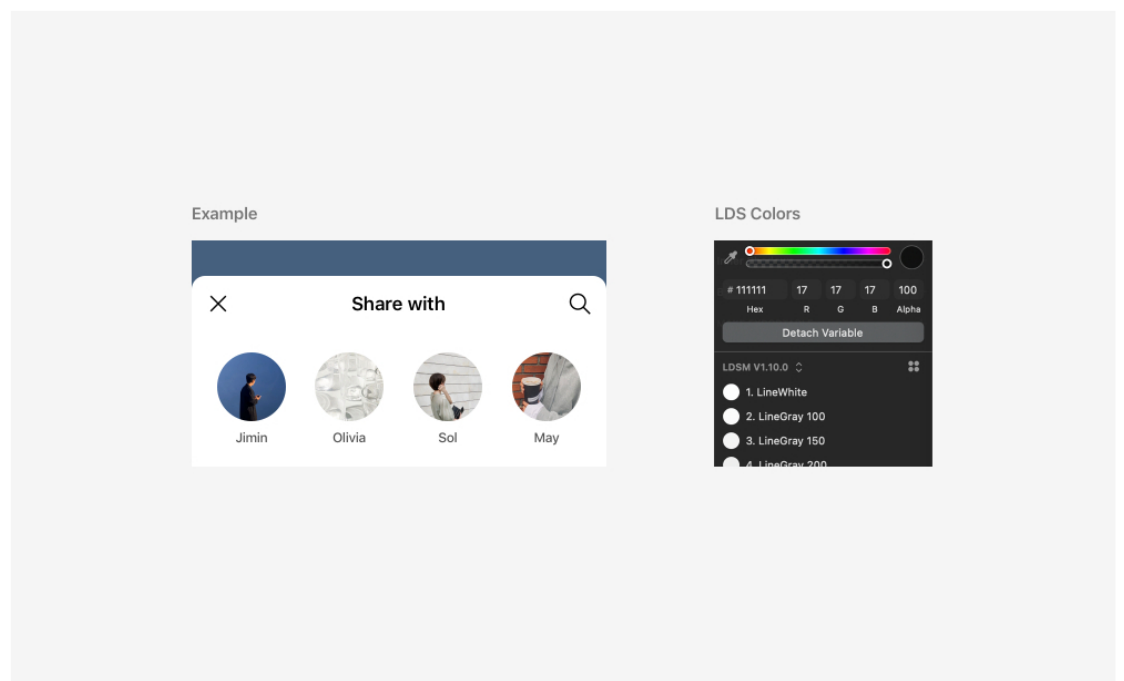

How to Provide Design Guide

Work Process for applying Semantic Color as Designer

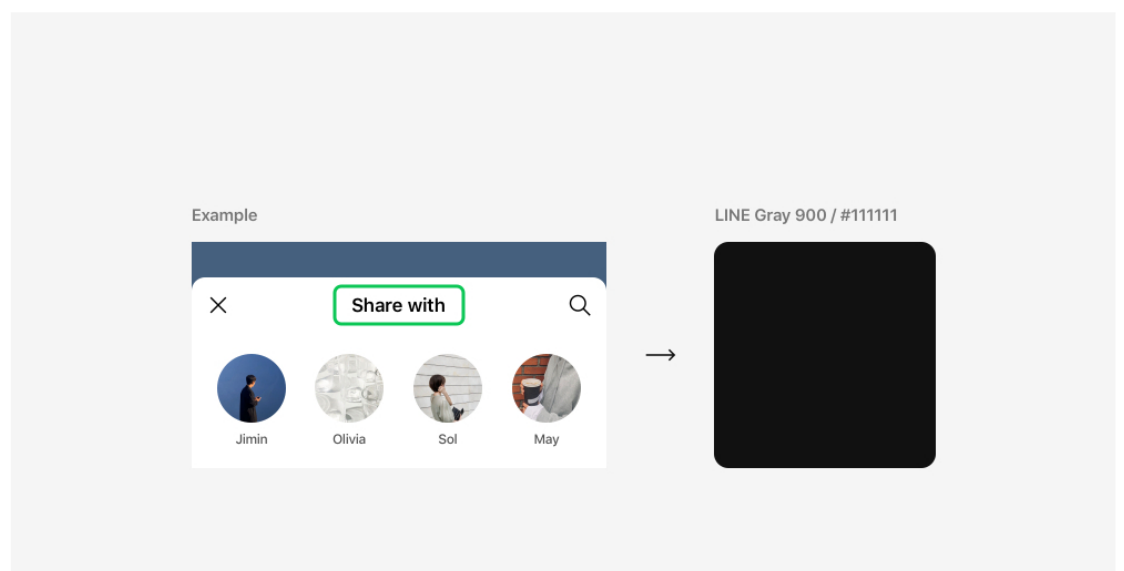

1. Design with LINE Design System Color

To apply semantic colors, you MUST design with LINE Design System Colors.

2. Match LINE Semantic Colors

The color in the example above is Gray 900 in Light Mode. Check the corresponding color as shown below.

Example - Wikipage

Gray 800			septenaryNeutralFill		
	#2A2A2A	#B7B7B7 / Gray 400	senaryText		
		#616161 / Gray 650			
Gray 900			primaryText		
	#111111	#FFFFFF / White	octonaryAltNeutralFill		
			octonaryNeutralFill		
		#616161 / Gray 650	primaryDark		
			secondaryDisabled (40%)		
		#111111 / Gray 900			

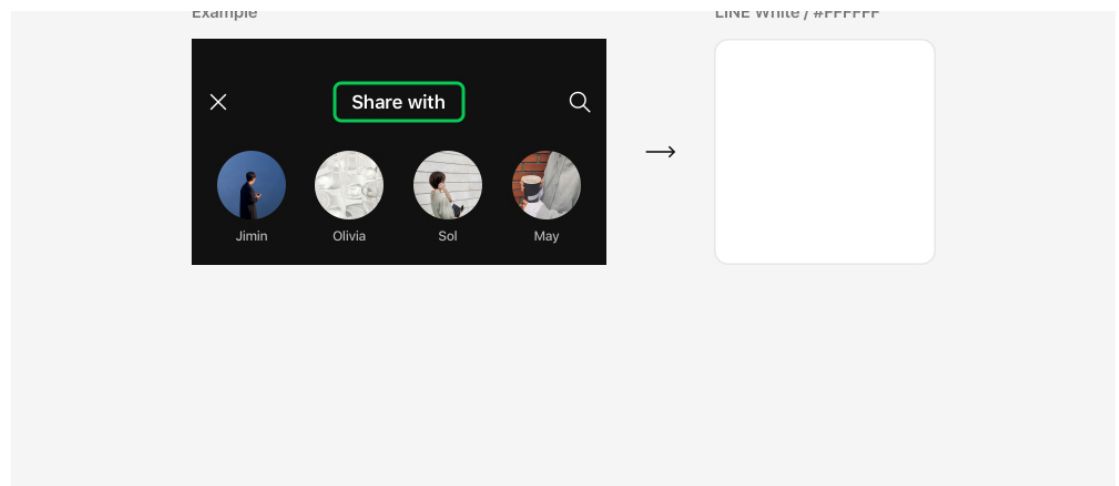

Identify the semantic color that corresponds to the appropriate category.
The color in the example above belongs to the 'Text' category, so you should use 'primaryText' as example below.

Example - Wikipage

Gray 800			septenaryNeutralFill		
	#2A2A2A	#B7B7B7 / Gray 400	senaryText		
		#616161 / Gray 650			
Gray 900			primaryText		
	#111111	#FFFFFF / White	octonaryAltNeutralFill		
			octonaryNeutralFill		
		#616161 / Gray 650	primaryDark		
			secondaryDisabled (40%)		
		#111111 / Gray 900			

3. Test LINE Semantic Colors

Check the matched semantic color for Dark mode.

If there is no available LINE Design System Color for Dark mode, we need to create a new semantic color. Contact Product UX team or Design Ops team.

4. Guide LINE Semantic Colors

Rule	Example
[Semantic Color's Name]	[defaultText]
Light : #light mode color	Light : #lineBlack
Dark : #dark mode color	Dark : #lineWhite
