List

A list means a group of vertically aligned items as a collection of text and text/image combinations.

Anatomy

List item content

1. List

2. Row

3. List item content

3-1. Left area (Guided, Optional)

It is the left area of an item included on the list. You can include images, profiles, and icons to identify items.

3-2. Text area (Custom)

As a text area, it displays the title and the content of an item.

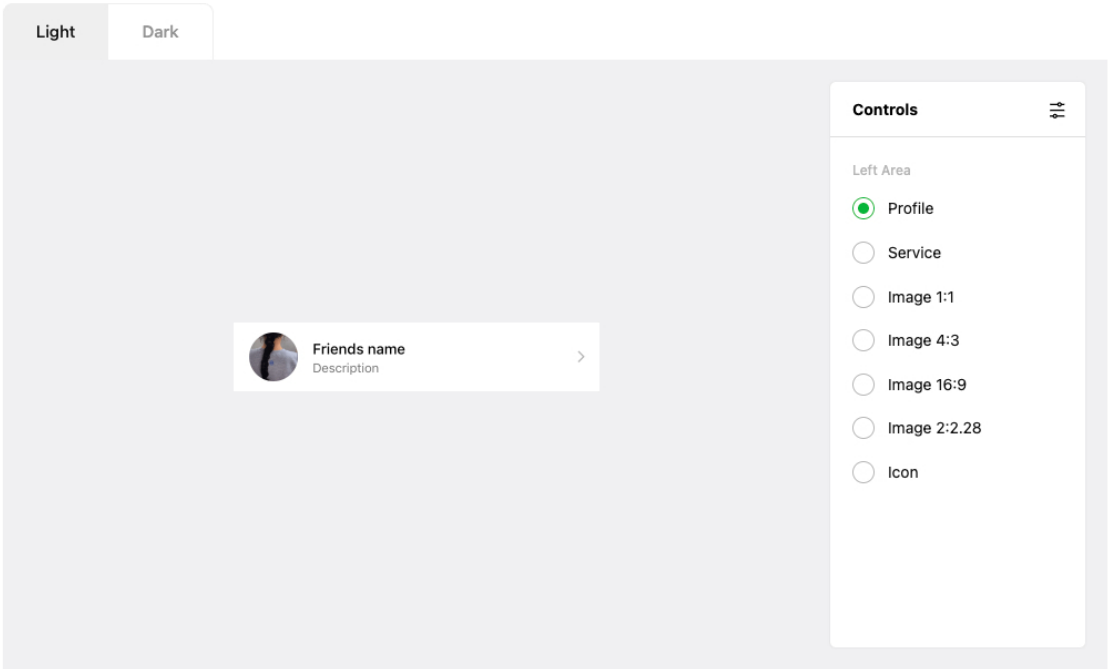

3-3. Right area (Guided, Optional)

It is the right area of an item included on the list. You can include icons and text buttons that control an item or the option information related to an item.

Types

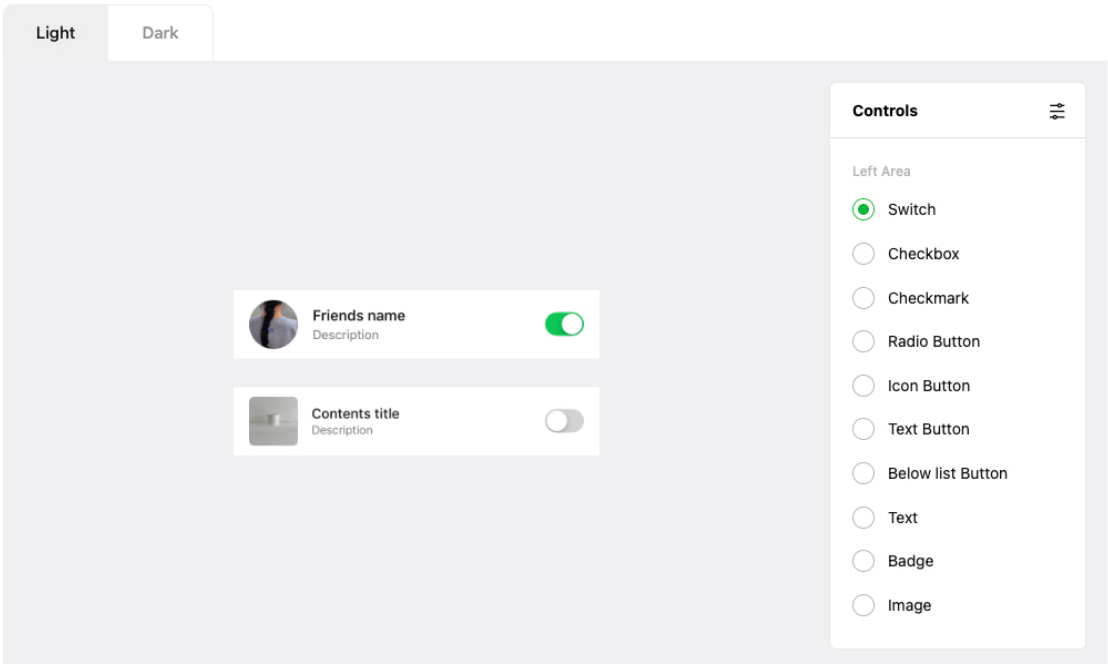

A list component is provided as a single component. You can configure a list by placing the following elements in the left and right areas of an item.

Left area

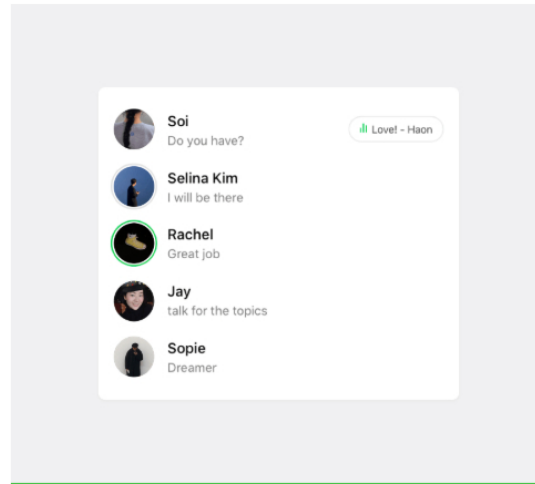

You can include images, profiles, and icons to identify items in the left area.

Right area (option area)

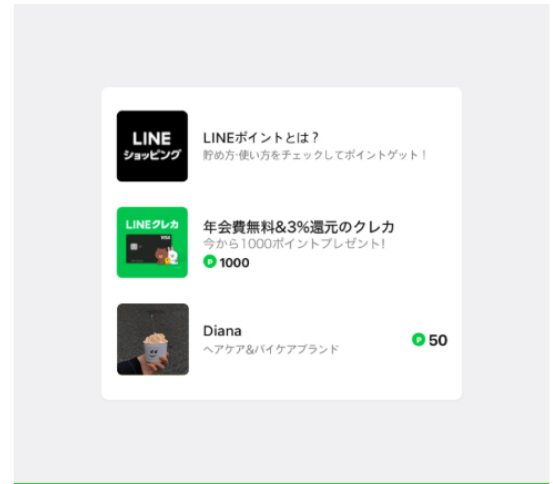

You can include text and images, etc. showing buttons, controls, and values related to the item in the right area.

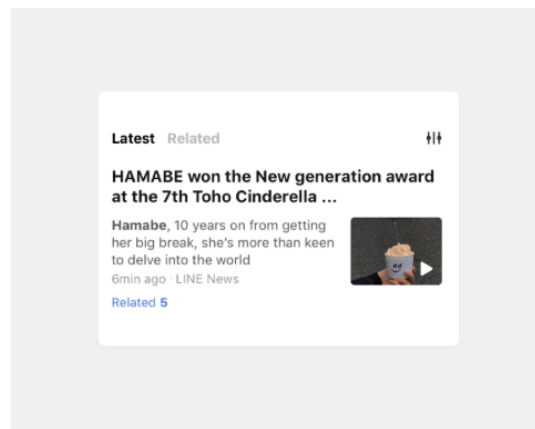

Do

The main purpose of placing profiles or images in the left area is to identify items on the list.

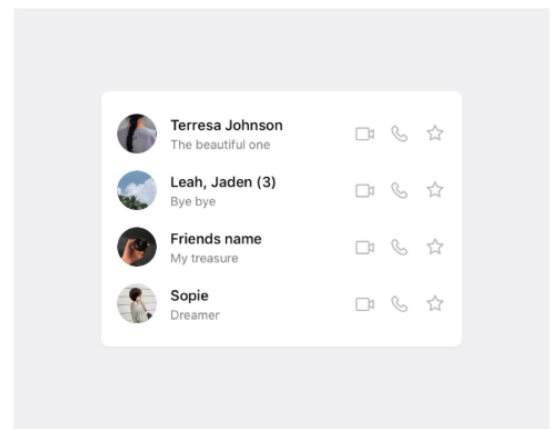

Do

You can configure the text area using necessary elements according to users' needs.

Caution

Image element can be placed in the right area when the image is not the primary content on the list. (e.g. Primary content of news search list: title of the article)

Caution

If three or more buttons are placed in the right area, it may interfere with usability, because the content area will become too narrow and there will not be enough room to touch the buttons. (Use of the overflow button or the below list type is recommended)

States

Normal

This is the default state.

Highlighted

Items, such as "New item" or "Added item," are highlighted on the list.

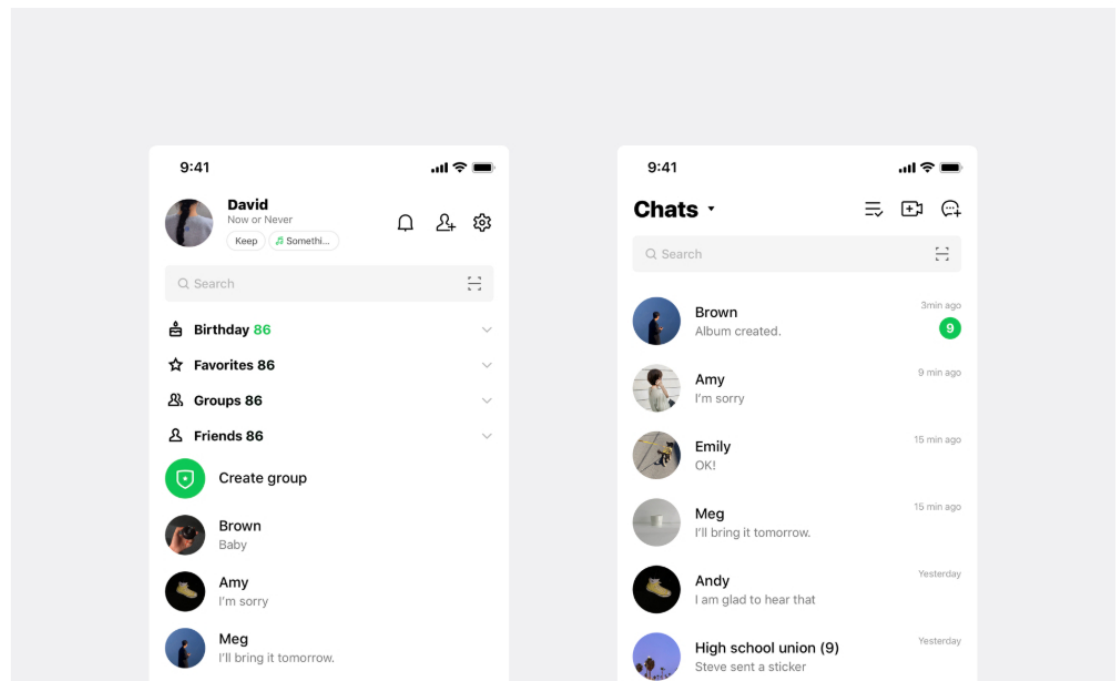

Pressed

The user is pressing the item on the list.

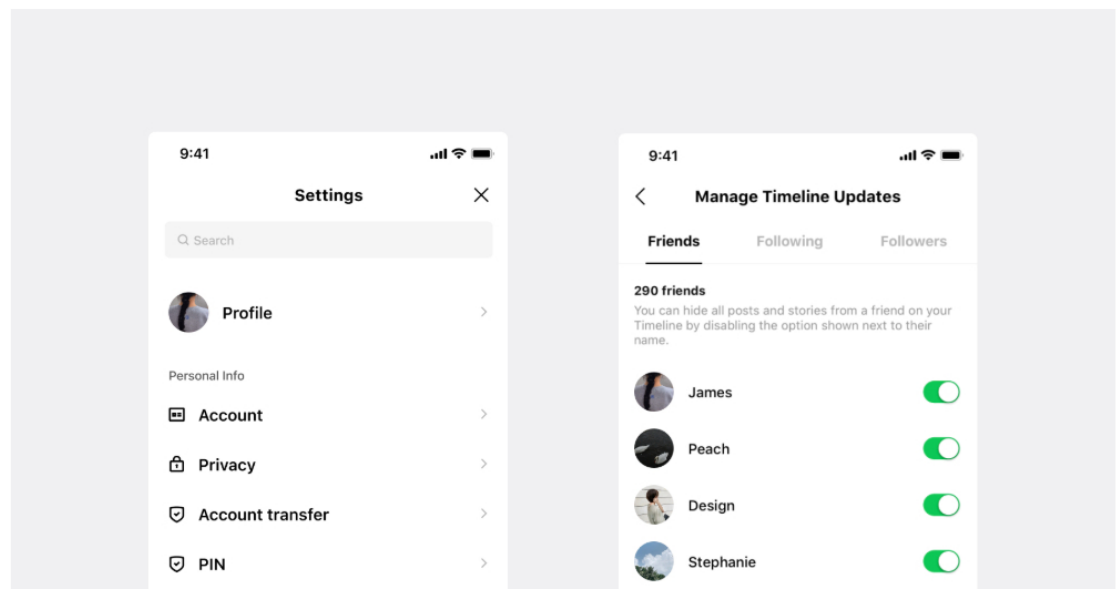

Usage

Friends lists, Chat lists

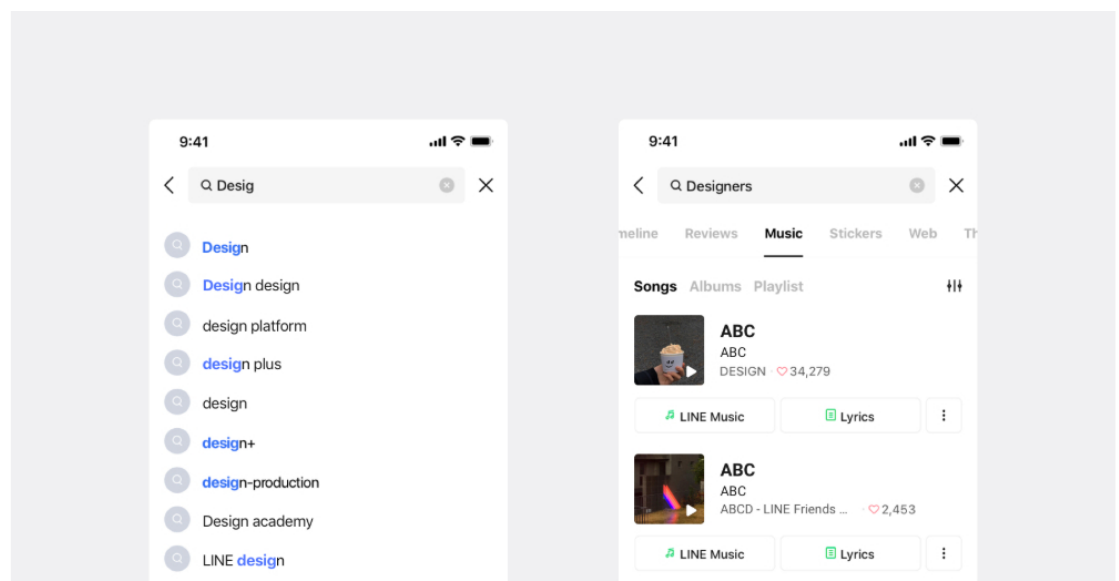

You can identify friends and chat rooms on the list by placing a profile on the left of the list.

Settings

Search results

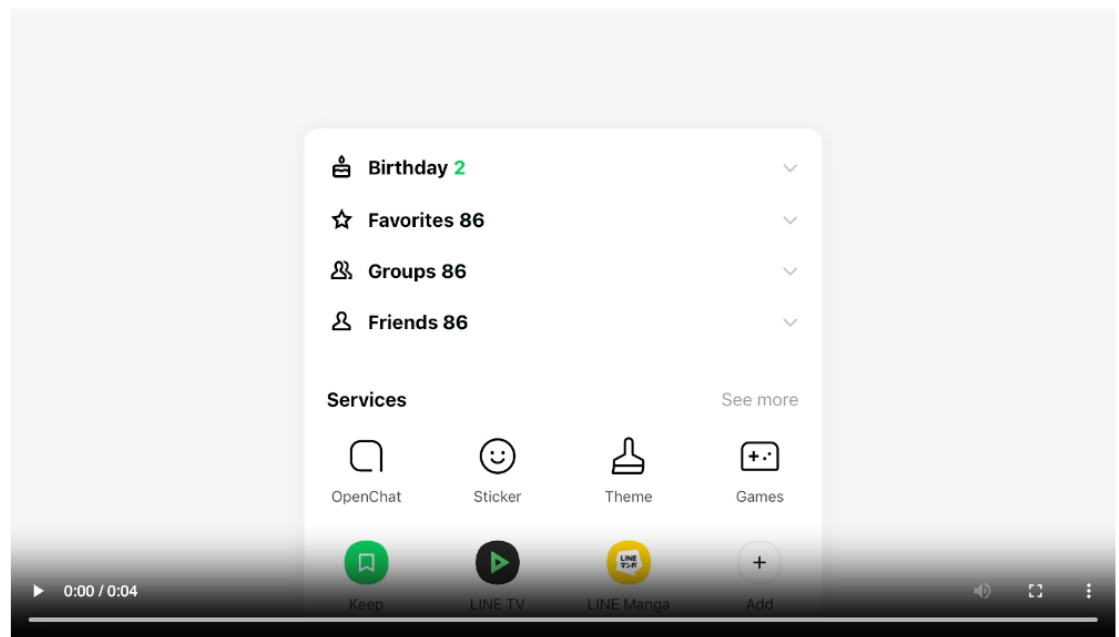

The autocomplete list and the search result list during search are applied as follows.

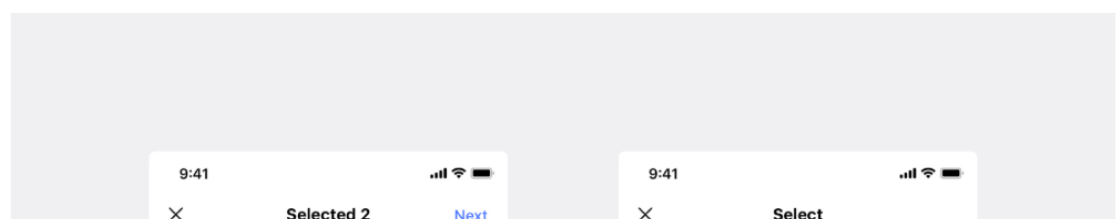

Actions

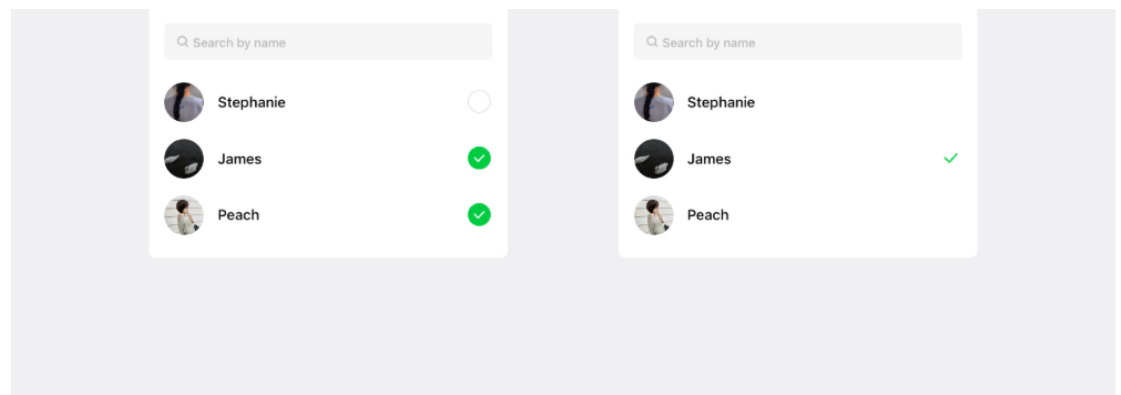

Expand and Collapse

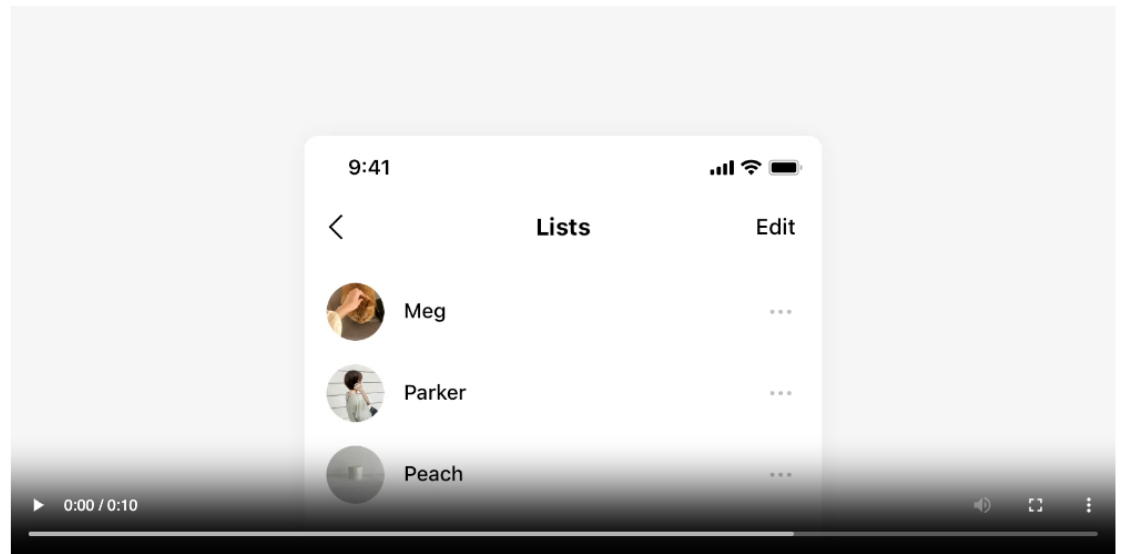

If you apply the expand/collapse feature, you can try to expose a specific area better or apply a hierarchy to the items on the list.

Selection

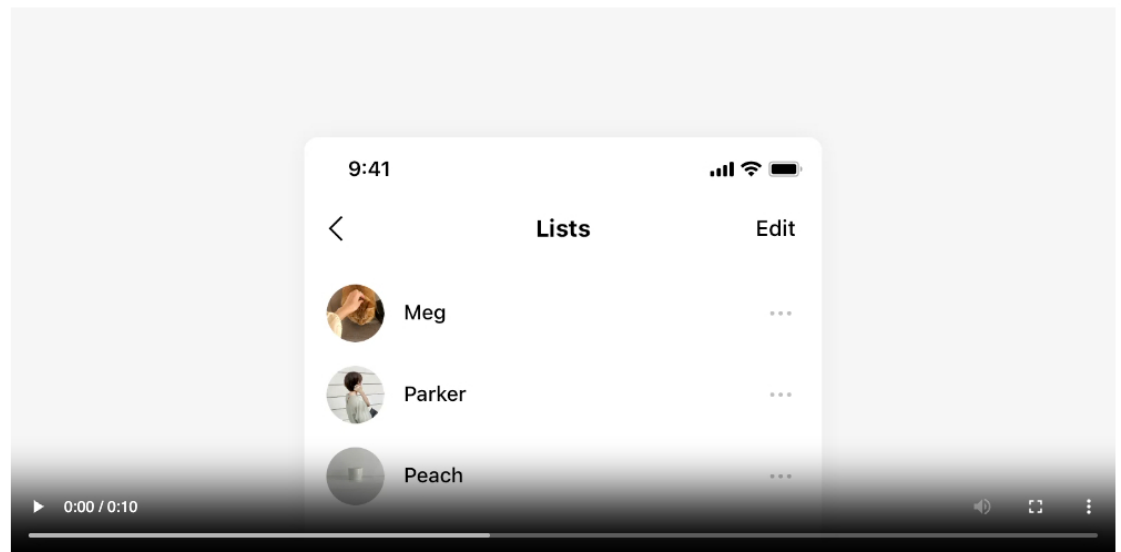

It is used to select the items on the list in the editing mode. It uses an appropriate control UI depending on whether it is a single selection or multiple selection.

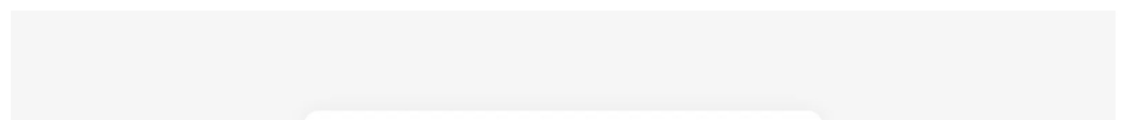

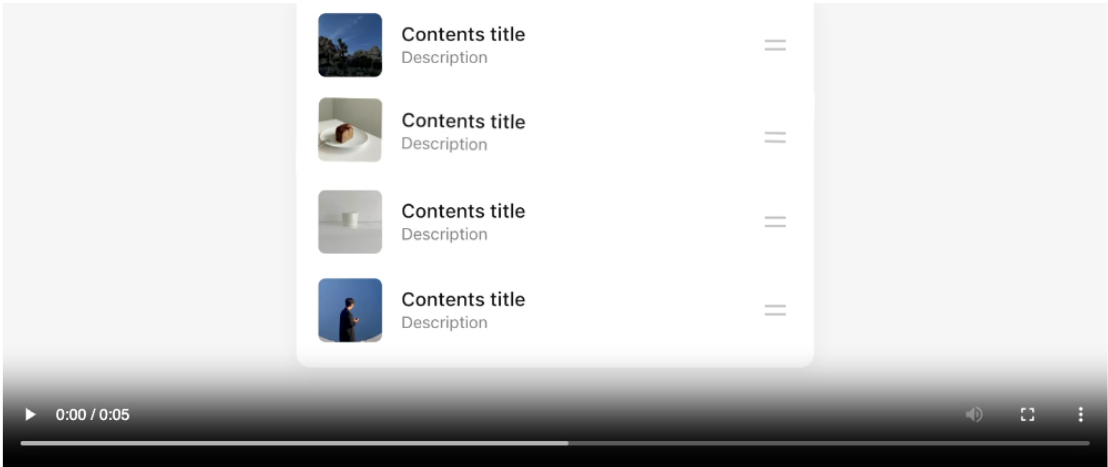

If there is a button on the right and it is difficult to remove the button in editing mode, you can apply the select control on the left.

If you can hide the button located on the right when entering editing mode, provide the select control on the right.

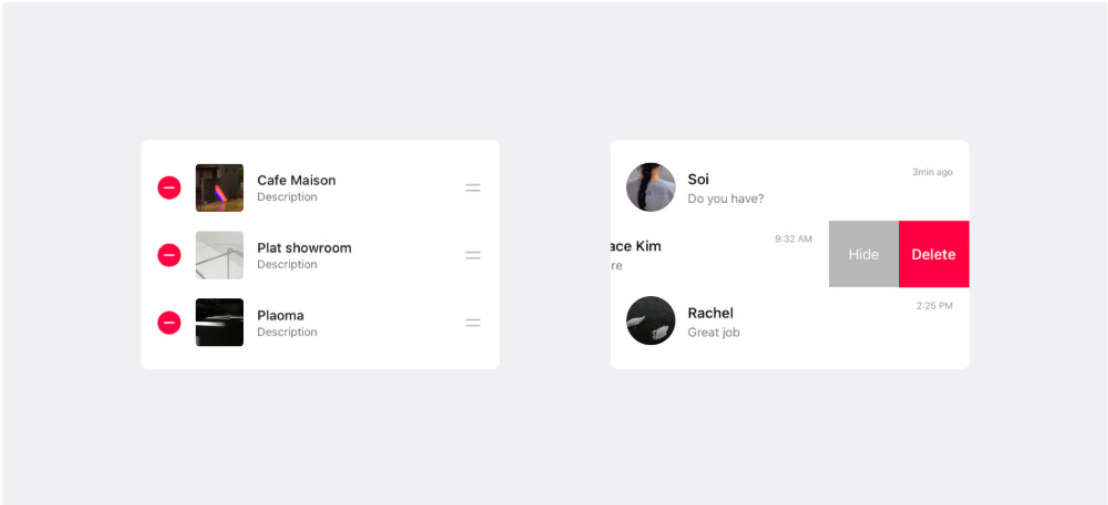

Reorder

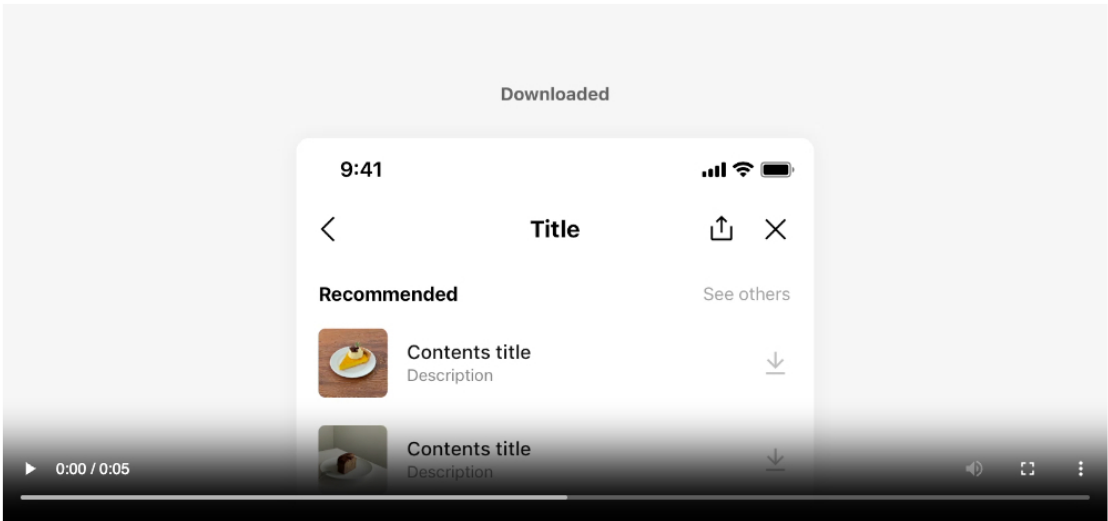

You can change the order of items on the list as follows.

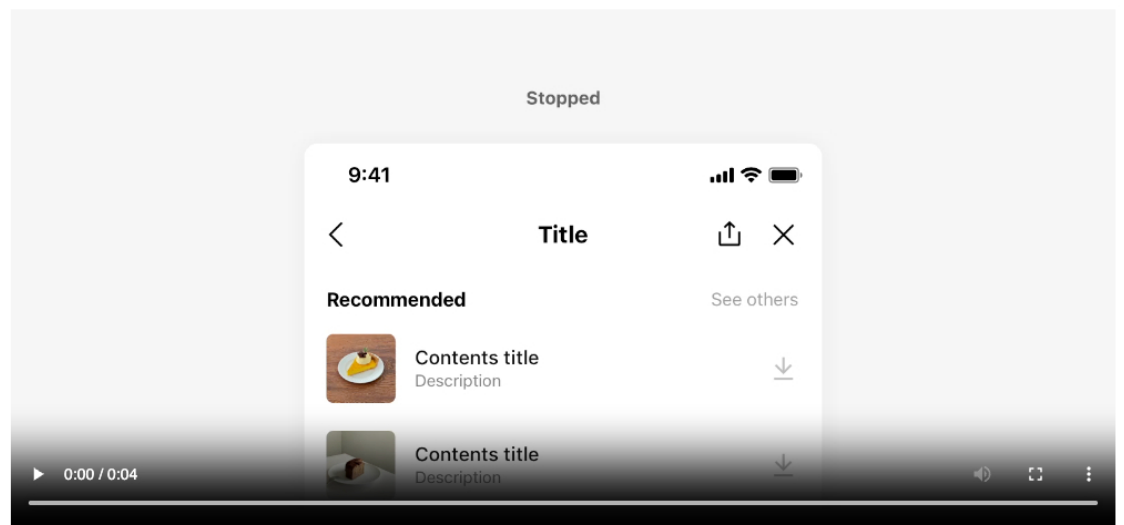

Delete

- As a method for deleting an item on the list, you can provide the swipe gesture or expose the Delete button on the item if editing mode is supported.
- Editing mode is generally used if a number of items must be controlled simultaneously. If it is more convenient to control by item, then it is recommended to use gestures.

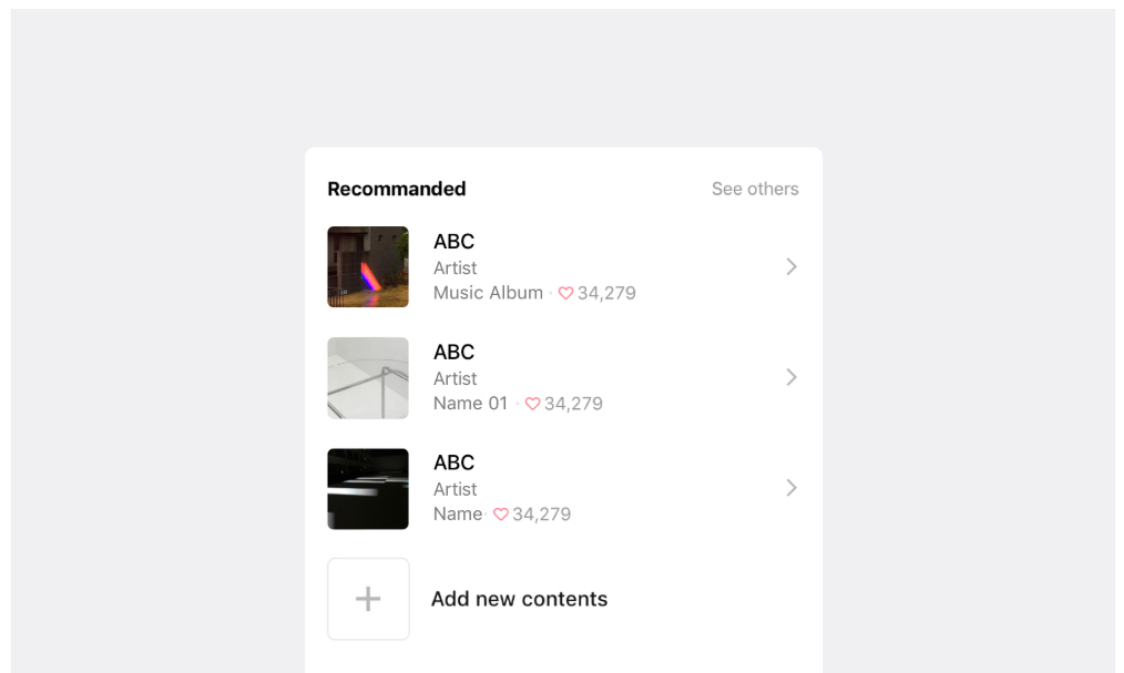

Download

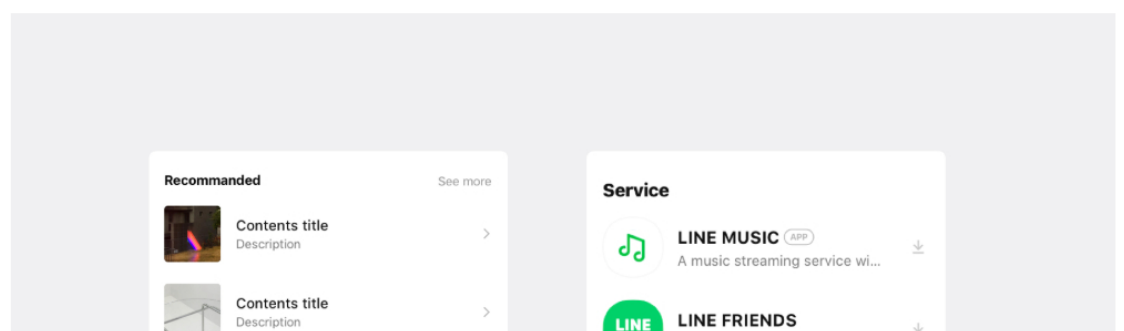

When the download takes place on the list, the component is switched as below according to the situation by each stage of download progress using the following icons.

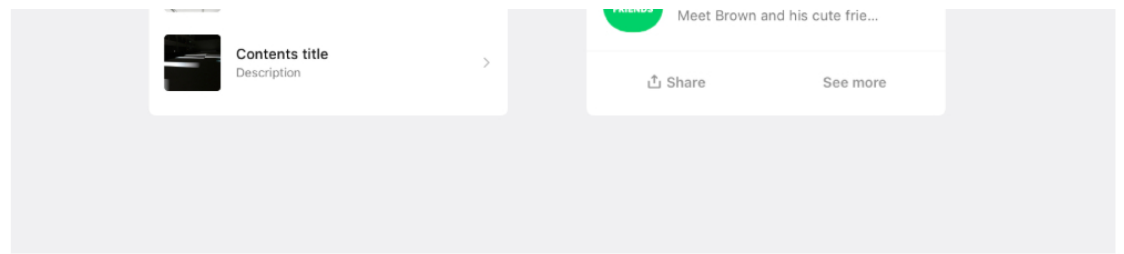

Add

- An Add button may be provided to add a new item at the uppermost or the bottommost part of the list.
- There are also methods, such as using a floating action button or applying an action button, to the right side of the top navigation in addition to providing an Add button on the list.

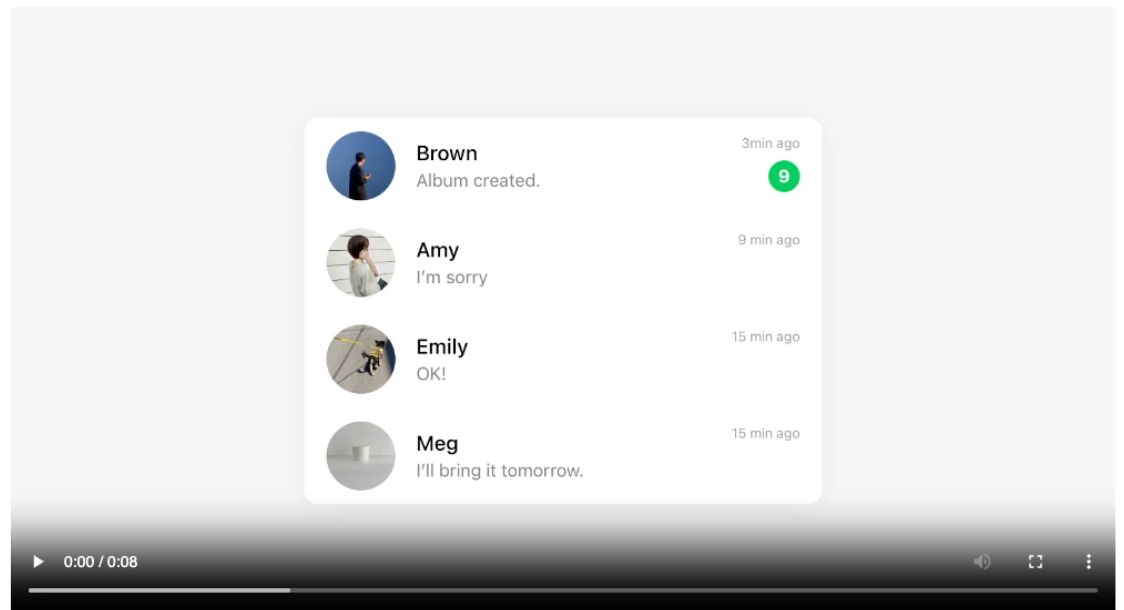

See more

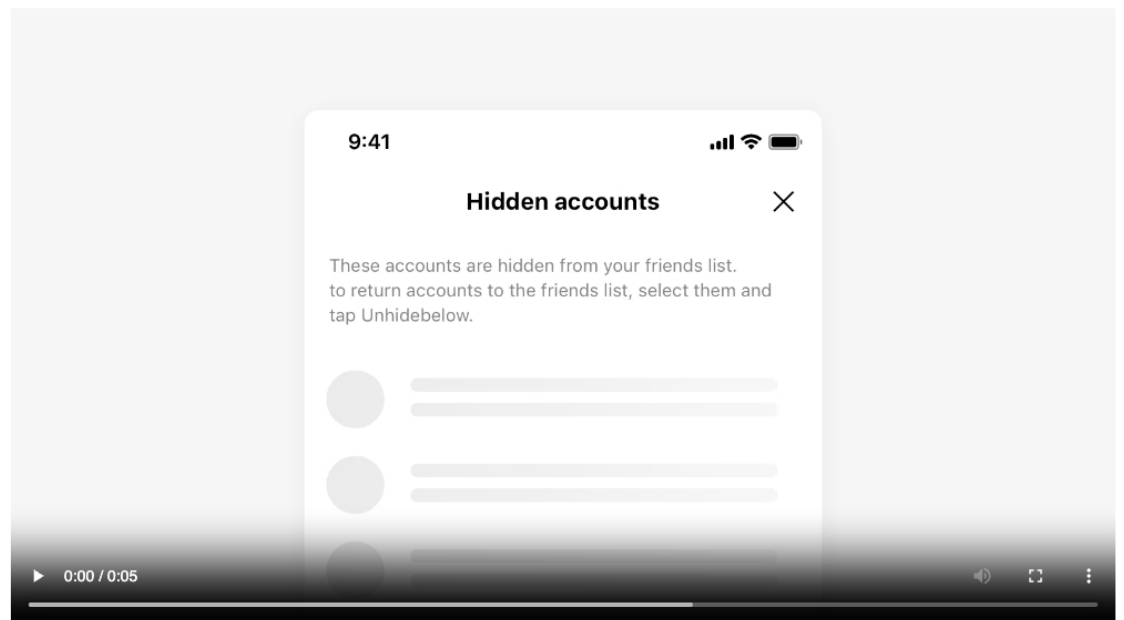

If only a part of the list is exposed, you can import more lists or provide a text button to go to the detailed page as above.

Swipe gesture

This is an easy method for setting items on a list individually. (The swipe gesture has different specifications for Android and iOS)

Skeleton UI

You can use a skeleton UI as an imaginary form of the actual list while importing the content just after entering the screen.
