

UX GUIDELINES

[Common action guides](#)[Confirmation](#)[Feedback](#)[Modal](#)[Navigation](#)

Modal

A modal screen is a screen that floats above the current screen. Using modality, you can provide a clearer workflow through the interaction between the floating screen and the screen below. Even in LINE, tasks such as “creating a chat room” are provided in modal view to emphasize important information. In this guide, we intend to secure the consistency of LINE modality by providing clear usage standards for modality in LINE, and also by presenting a more detailed guide on the modal view types and top navigation.

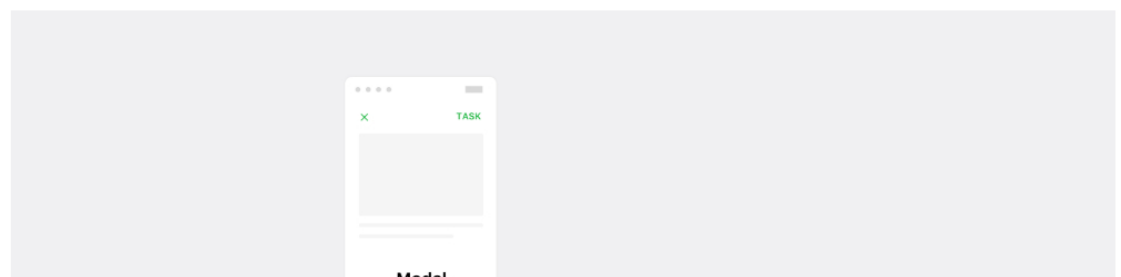

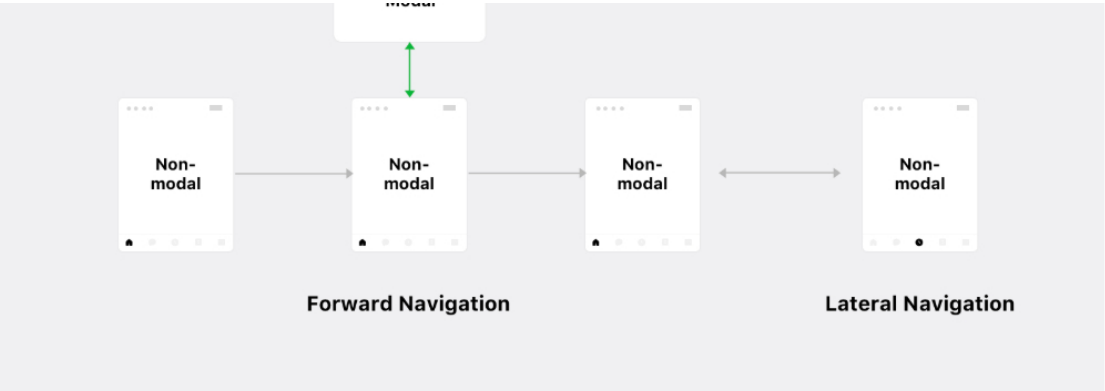

Why use ‘Modal’?

Users will feel like they’re performing a different task by deviating from the existing context once they enter the modal window as the previous screen becomes disabled. Through this, modal provides an environment to concentrate on the task for users without missing important information.

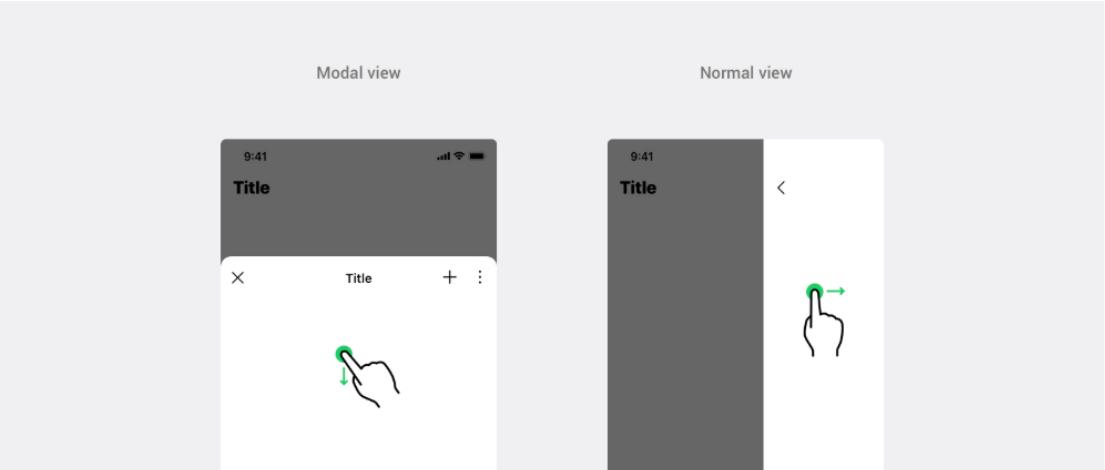

Modal View vs Normal View

Normal view is used for regular screens that are not concentrated on a specific task, and modal view is used for the tasks with clear starting and ending points, such as taking pictures or sharing, and the tasks with new experiences different from the existing flow. Unlike normal view, one must complete the task within the modal window or close the modal window to return to the previous screen.

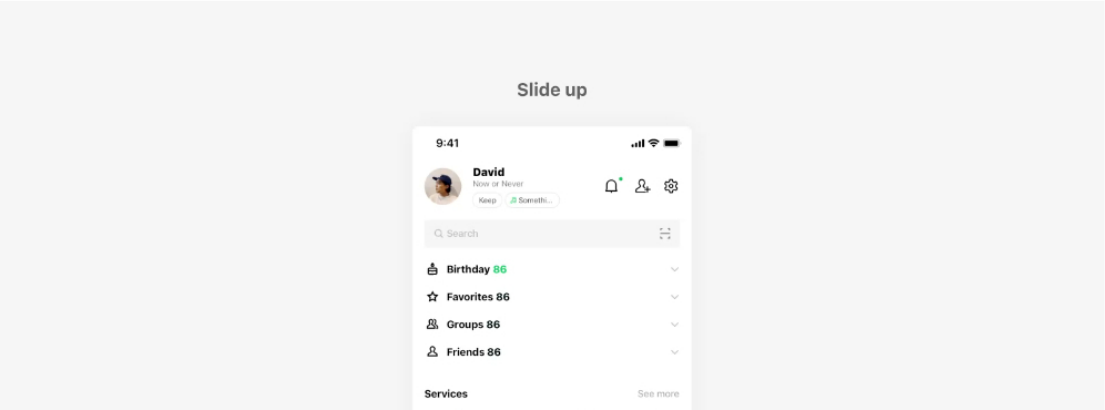

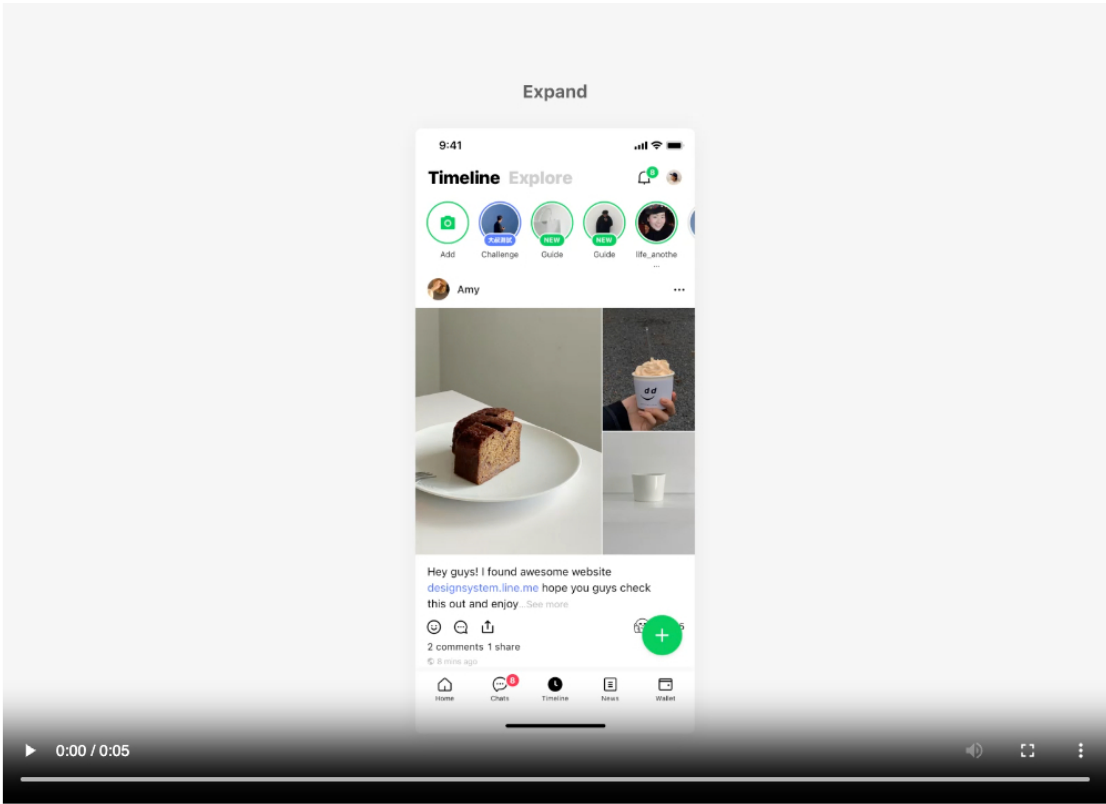

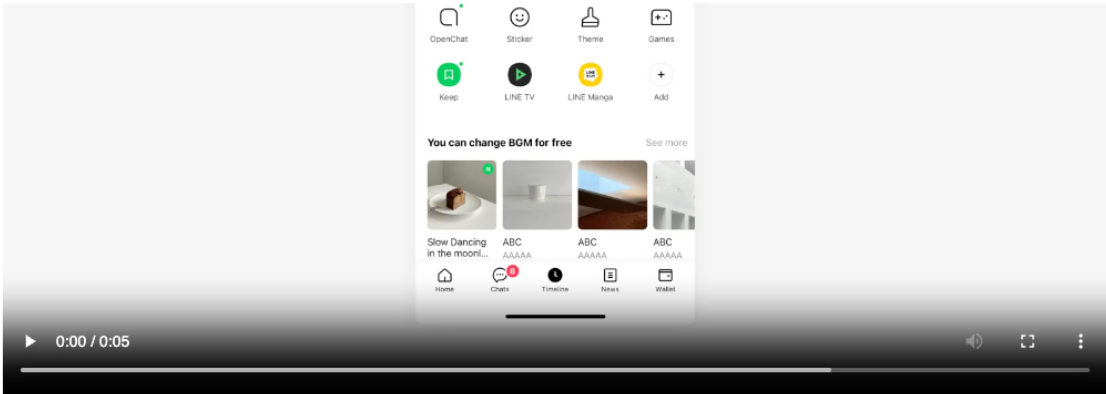

As a difference to be careful with, normal view can induce free movement of users because it is possible to maintain the bottom navigation. As it is important to easily move back and forth between the main services of the bottom navigation, including Home, Chat, LINE VOOM, and News in LINE, one must decide whether to provide modal view considering the fact that it is impossible to maintain the bottom navigation if modal view is used.

Modal view and normal view also have differences in their components and interactions. The typical difference is placing the "Close" button for modal view and placing the "Back" button for normal view. The slide-up transition is used when entering modal view, and you can return to the previous screen using the "Pull to Dismiss" gesture. The slide-in transition is used when entering normal view, and you can return to the previous screen using the Swipe-Back gesture.

	Modal View	Normal View
Dismiss Button	X Button	< Button
Dismiss Gesture	Pull to dismiss	Swipe Back
Transition	Slide up Quick change Expand / Contrast	Slide In
Sustain Main Tab	Impossible	Possible

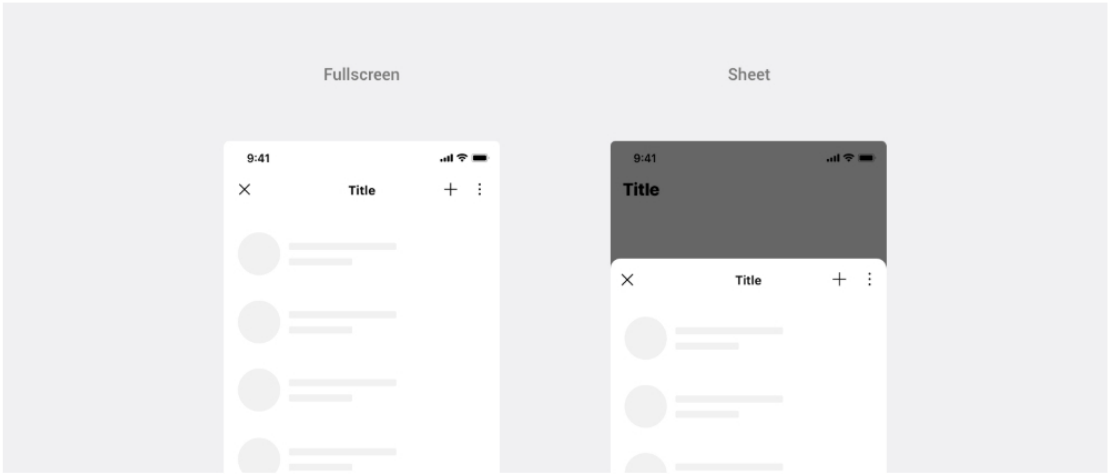

While slide-up is used by default for the transition when entering modal view, it is also possible to provide a separate transition to recognize the context transition well.

Modal View in iOS & Android

The modal view of each OS has different characteristics. iOS provides a separate independent view type called Automatic System modal view. In the case of Android (AOS), it is necessary to use with precaution because there is no difference in transition when entering modal view and normal view.

	iOS	AOSe
OS Component	Modality	Full-Screen Dialog
Modal Transition	Slide-Up	OS default
Modal View	Fullpage Modal Automatic Modal LIFF	Fullpage Modal LIFF

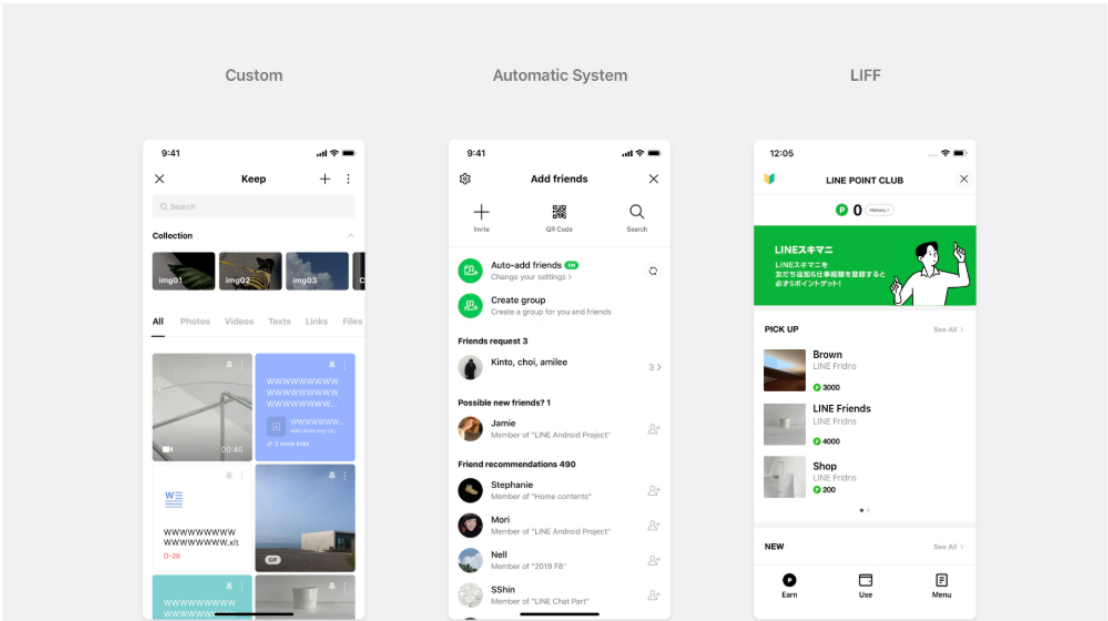

Type of Modal View

Modal view is provided as a sheet type to overlay the full screen part covering the entire screen. Providing a full screen type is recommended for drawing the user's attention as much as possible, and providing a sheet type is recommended if it is necessary to proceed with the task without losing the context of the existing screen.

	Fullscreen	Sheet
Description	Focus attention by overlaying the existing screen.	Maintain the context by providing the existing screen as a scrim area. Can adjust the height with the handle bar if a resizable sheet is used.
Dismiss by	Select the close area, the swipe-down gesture	Touch the dim area, select the close area, the swipe-down gesture
Usage	If a high level of concentration is required for the modal task	If the task must be performed by recognizing the context of the existing screen

Fullscreen Type Usage

	Height	Usage	iOS	AOS
Custom	100%	Profile, Keep	✓	✓
Automatic System	100%	Create chat, Edit chat list	✓	✗
LIFF	100%	LINE Pay, Open Chat	✓	✓

Sheet Type Usage

	Height	Usage	iOS	AOS
Custom	0 - 98%	Share with, Profile QR code	✓	✓
LIFF	50% 70% 98%	Shopping Talk, GIF Magazine	✓	✓

When to use 'Modal'

Although modal lets users concentrate on the screen by excluding the elements that can make users become distracted, it also has the nature of restricting users from moving to another screen. The use of this is recommended only when such a characteristic of the modal is used as an advantage.

In case of the modal of a complicated task, the user ends up forgetting the task which was in progress on the previous modal screen. For this reason, it is better to maintain the task as simple, short, and concentrated form.

DO

Use of normal view is recommended on screens with a sequential flow.

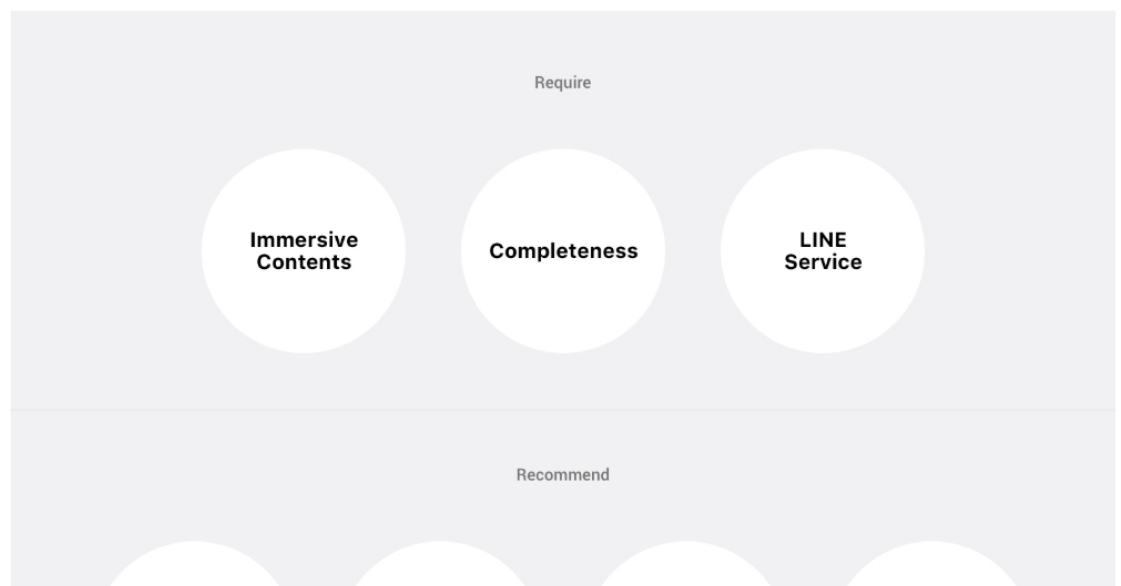

Modality Criteria & Checklist

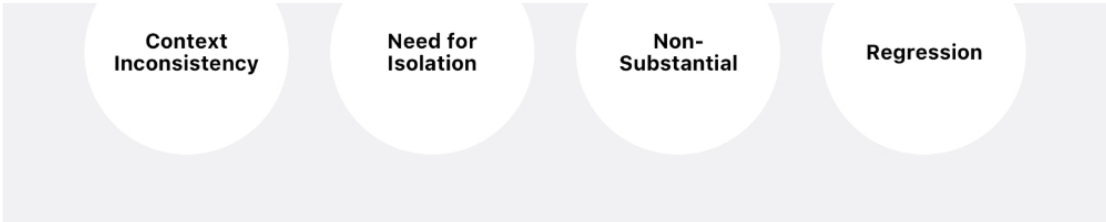

Here are the criteria for using modality and the checklist that can be used for reviewing whether to provide modal windows. The criteria plan is divided into the required criteria for using modality and the recommended criteria for using modality. The required criteria must be provided as modal windows since they're are cases that require the user's attention.

Modal in Modal: If a modal is exposed repeatedly in a modal, users will have difficulty with finding the previous screen and may lose the usage context. Therefore, providing normal view is considered first for the criteria, other than the required ones, when there is a redundant modal.

iOS Android

Modality Criteria

Required

Immersion	When the modal task is immersive content or when the full screen is required.	Taking pictures, writing posts, QR code scan, and editing photos
Completeness	When the modal task has clear starting point and ending point	Add friend, create chat room, and create group
LINE services	Services provided by LINE	Sticker shop, theme shop, and LINE shopping

Recommend

Inconsistency of context	When the modal task has deviated from the existing context	Keep, Official Account
Necessity of isolation	When you must restrict the user from moving to another screen while performing a modal task	Scan bill
Unimportance	When the modal task is not related to an important task in the existing screen	Shopping Talk and GIF magazine
Regression	If one must return to the existing screen after completing the modal task	Enter the address and enter the date

Modality Checklist

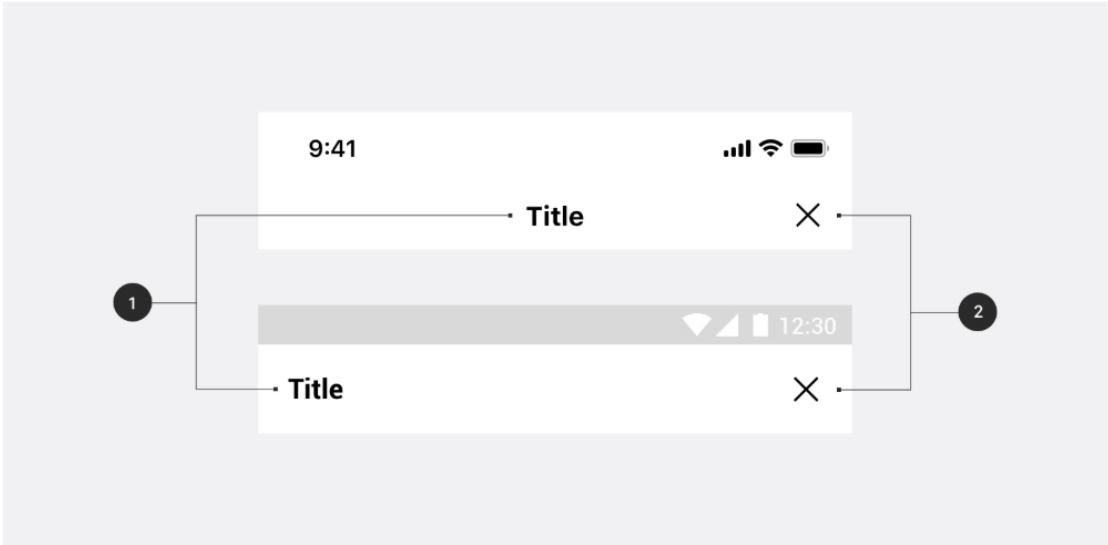

Required

Immersion	Is it a task which requires the full screen for the user's immersion for the content?	✓
Completeness	Is the task composed of a single line of flow from the starting point to the end point? (Linear flow)	✓
LINE services	Is it a LINE Family Service not related to the core functions of the bottom navigation?	✓

Recommend

Inconsistency of context	When the modal task has deviated from the existing context	✓
	Is it possible to identify the amount of information on the provided screen upon entry at a glance?	✓
	Is the menu structure provided upon entry simple and not complicated?	✓
	Are there many cases where the modal screen is generated again after entering the modal?	✓
Necessity of isolation	Is there an advantage to restricting the movement of users until completing or canceling the task?	✓
Unimportance	Is the task an important task for the existing screen?	✓
	Is it absolutely necessary to return to the existing screen	✓

Modal View Top navigation

1	Title	Provides a title to clearly identify the modal task.
2	Dismiss Button	Provides a button to perform the action to return to the existing screen. *Must be provided even in Android.

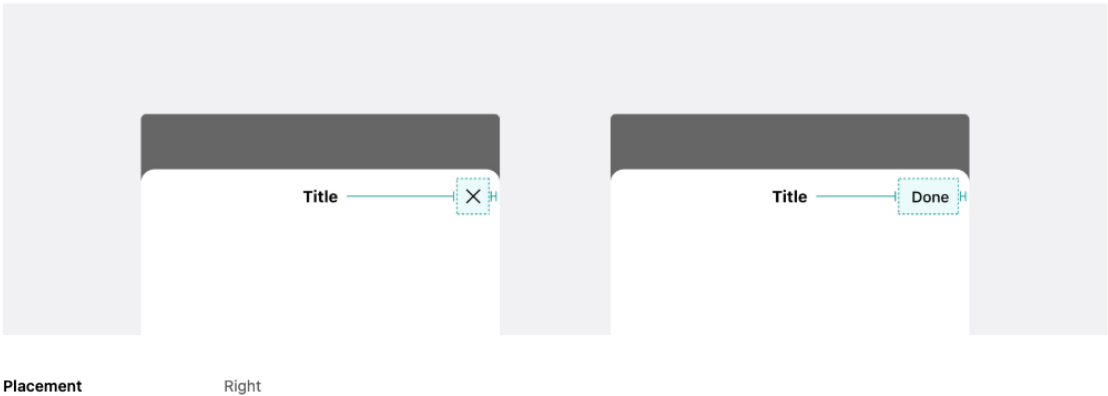

'X' Button Placement & Usage

The modal "X" button has two characteristics, consisting of Cancel or Complete task and Close. The "X" button is placed on the left if it performs the canceling role after being placed together with a progressive task. It is recommended to place it on the right for the purpose of completing or ending a task within the modal. Therefore, placing it on the right is recommended in most cases if only the "X" button is provided. This is because the "X" button is not used as a concept for canceling the task, but has the characteristics of completing the modal task or closing the modal.

Since the location of the "X" button can be provided flexibly according to the characteristics and the number of actions provided in the modal, proceed by referring to the guide below.

iOS Android

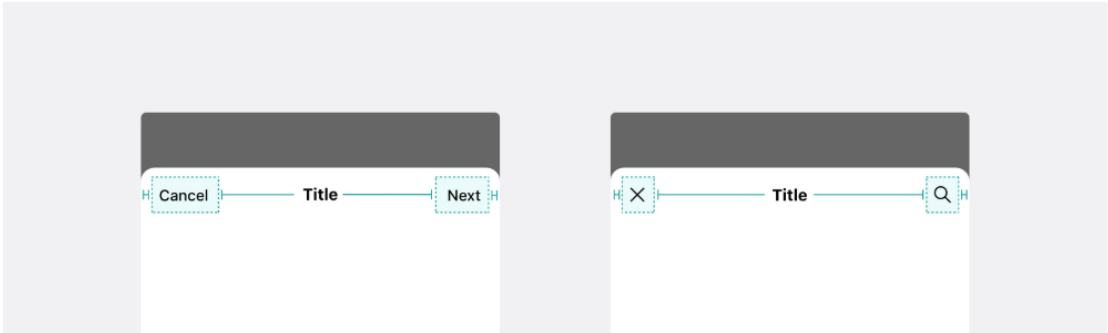

'X' button only

Usage

Place on the right if only the “X” button is used.
The text buttons, such as Close or Complete, can replace the “X” button.

with a progressive task

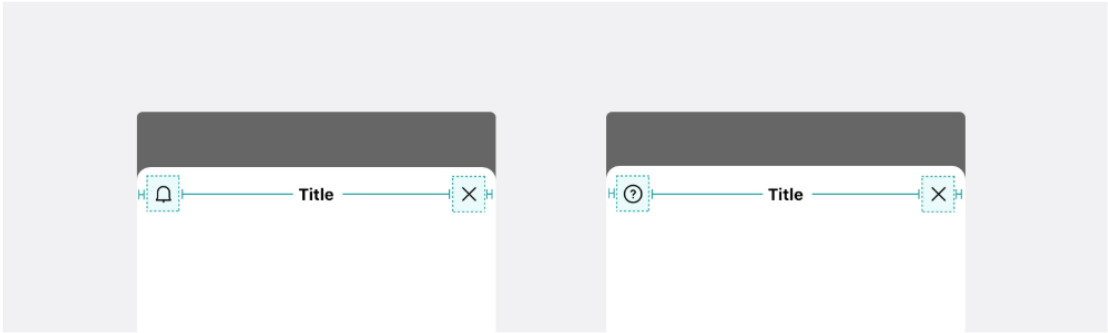

Placement

Left

Usage

Place the “X” button on the left in case of performing the canceling role by using it together with a progressive task, such as Next, Search, Save, and Done.
Consider using the text button, such as “Cancel,” even in the Close area in case of providing the task as a text button. If entered by pressing a text button, such as “Edit,” a text button, such as “Cancel,” must be used even in the Close area.

with Additional task

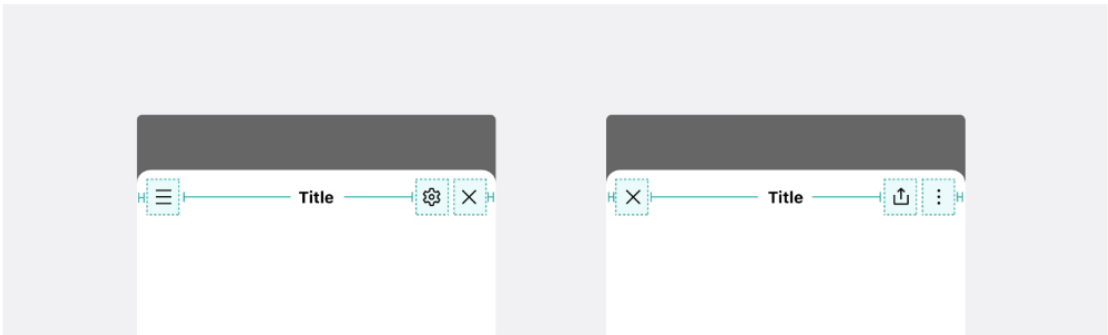

Placement

Right

Usage

Place the “X” button on the right in case of it being used together with an additional task, such as Edit, Setting, Alarm, My list, or Help.

more then two additional tasks

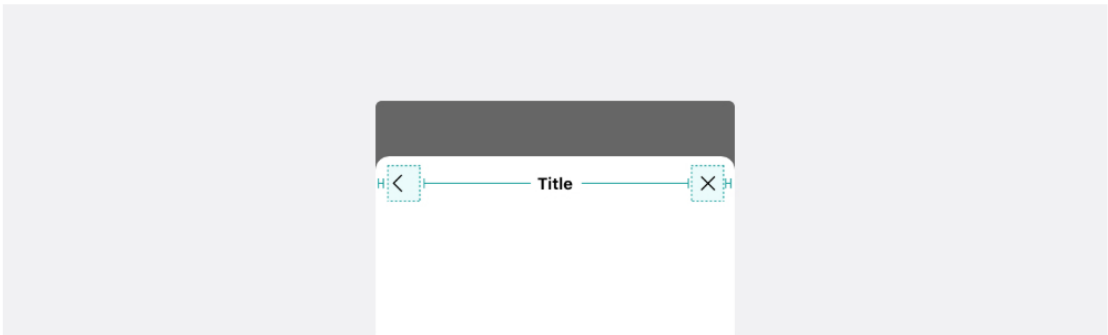

Placement

Right or Left

Usage

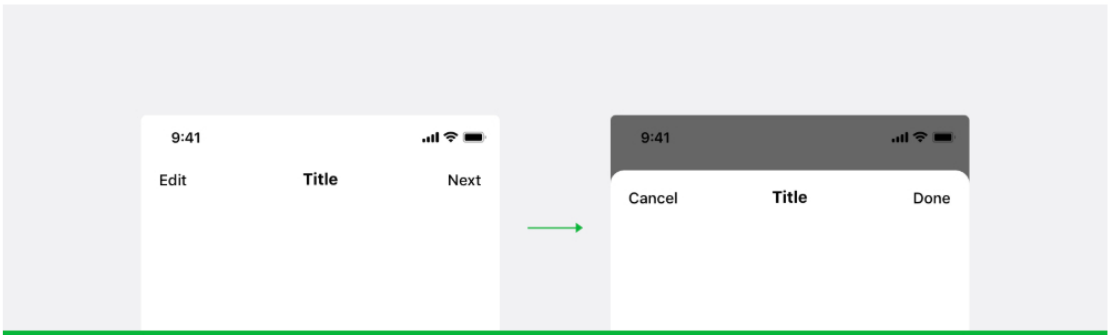

The “X” button can be placed on the left or right in cases where it is placed together with two or more additional buttons.

with 'Back' button

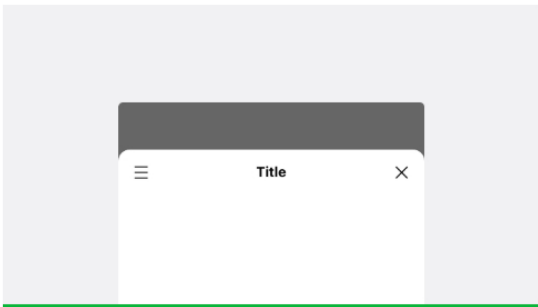

Placement	Right
Usage	Place the "Previous" button on the left and the "X" button on the right if depth is generated.

Do & Don't

Do
If it is efficient to keep the entry point of the previous screen and the 'X' button of the modal in the same position, the left placement of the 'X' button is possible.

Do
When used together with the menu button, it is recommended to place the 'X' button on the right in consideration of the user's familiarity with usability.

Do
It is natural to place it on the right with an effective touch path because using together with the View More button induces additional actions from the user. Placing the 'X' button to the left is recommended.

Caution

Precaution is required when placing the 'X' button in an area such as more view or menu button.
