

UX GUIDELINES

[Common action guides](#)[Confirmation](#)[Feedback](#)[Modal](#)[Navigation](#)

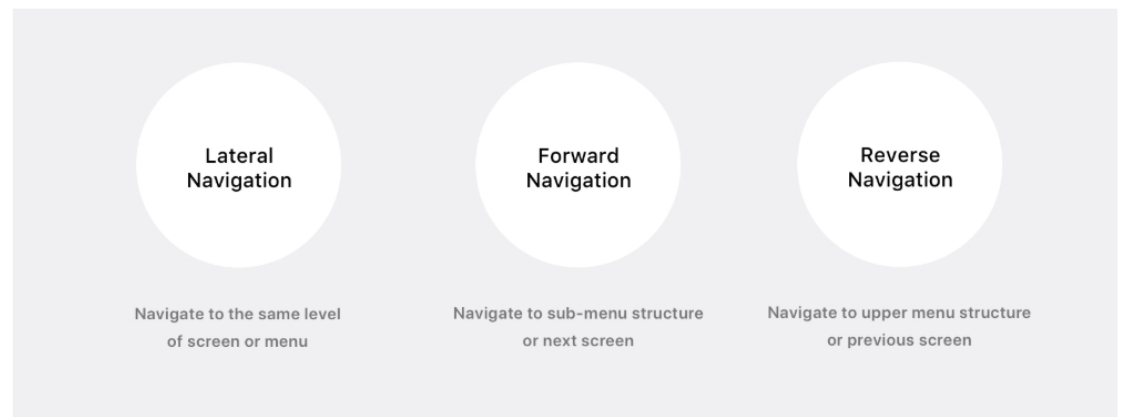

Navigation

Navigation is the most basic skeleton and information structure that constitutes a service. It is an important component used to guide user movement. In particular, the main navigation serves to convey the identity of the service.

Through navigation, users use the app with clear awareness of their current location, navigating and searching for the information they want. Therefore navigation must be designed to be easy to understand and consistent with the user's mental model.

Types of navigation

The types of Navigation can be classified as follows:

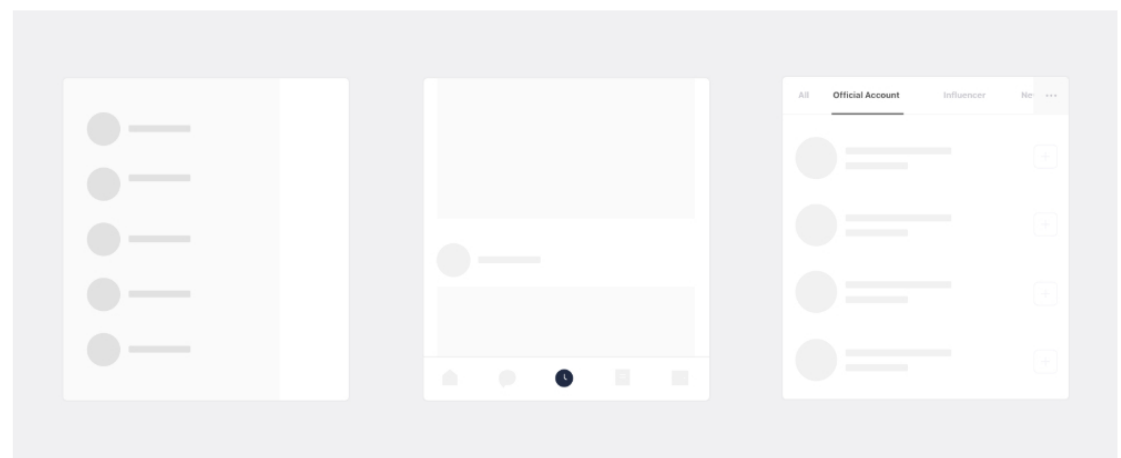

1. Lateral navigation

'Lateral navigation' helps the user navigate through the same level of menu access and related items.

For easy app navigation, provide the user with easy-to-understand and meaningful options.

Lateral Navigation is useful when providing these options.

Components used when providing 'Lateral navigation' are as follows.

	Navigation drawer	Bottom navigation bar	Tab
Usage	Top-Level destinations	Top-Level destinations	Any-Level of hierarchy
Number of destinations	More than 4	Between 3 and 5	More than 2
Description	Not Recommended*	Top-level menu consistent on every screen, allowing quick navigation and access between menus	Displays for menus of all levels in th hierarchy
		Tapping to move between menus	Tapping, swiping to move between menus

* Lots of research has been done that reveals usability issues when the navigation drawer appears. Google started to move important features/category items from Navigation drawers to tabs in their apps.

2. Forward navigation

‘Forward navigation’ enters the next screen or sub-menu structure from the current position.

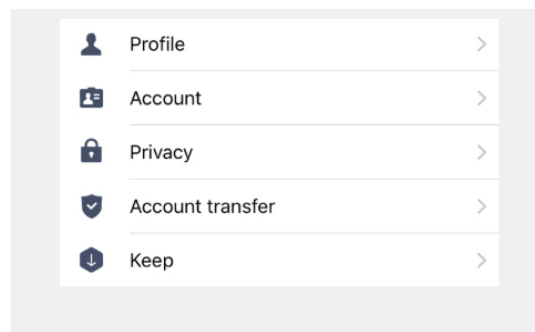

2-1. Downward flow

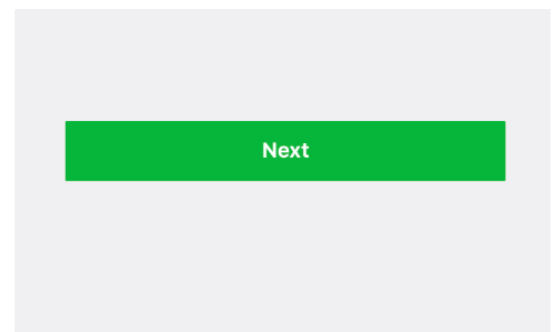

2-2. Sequential flow

From a higher level to a lower level, it moves down in the hierarchy to access deeper content.

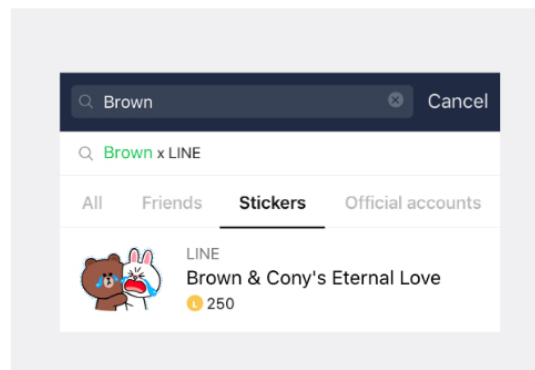

- Content container (Cards/ Lists/ Image lists)
- Links

It can be seen on the screen in sequential order, such as through the flow or checkout process.

- Buttons

2-3. Direct flow / Jump

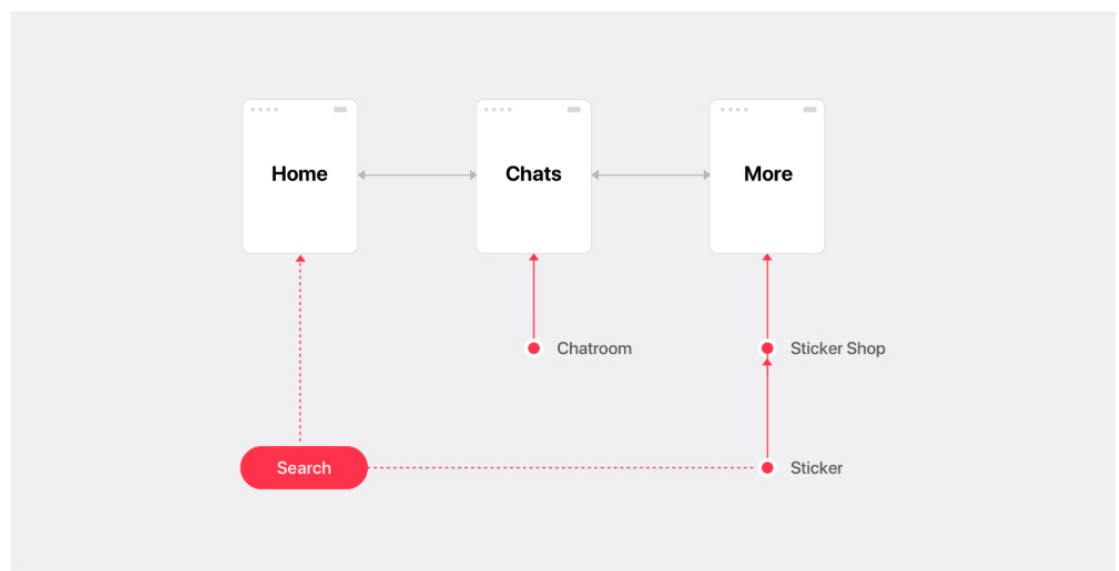

It moves directly from one screen to another.

- In-App search

3. Reverse navigation

'Reverse navigation' moves from the current position to the previous screen or structure.

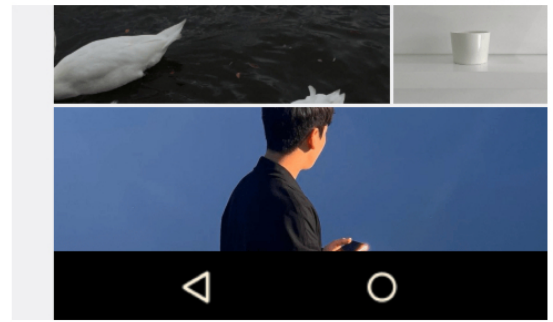

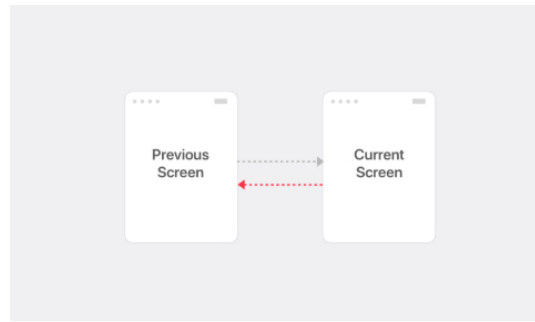

'In reverse navigation, the relationship between higher level and lower level should be clearly recognized.

For example, if a user directly navigates to the sub-structure screen through a search from his current location, the user should be able to easily find and access the path to the top screen.

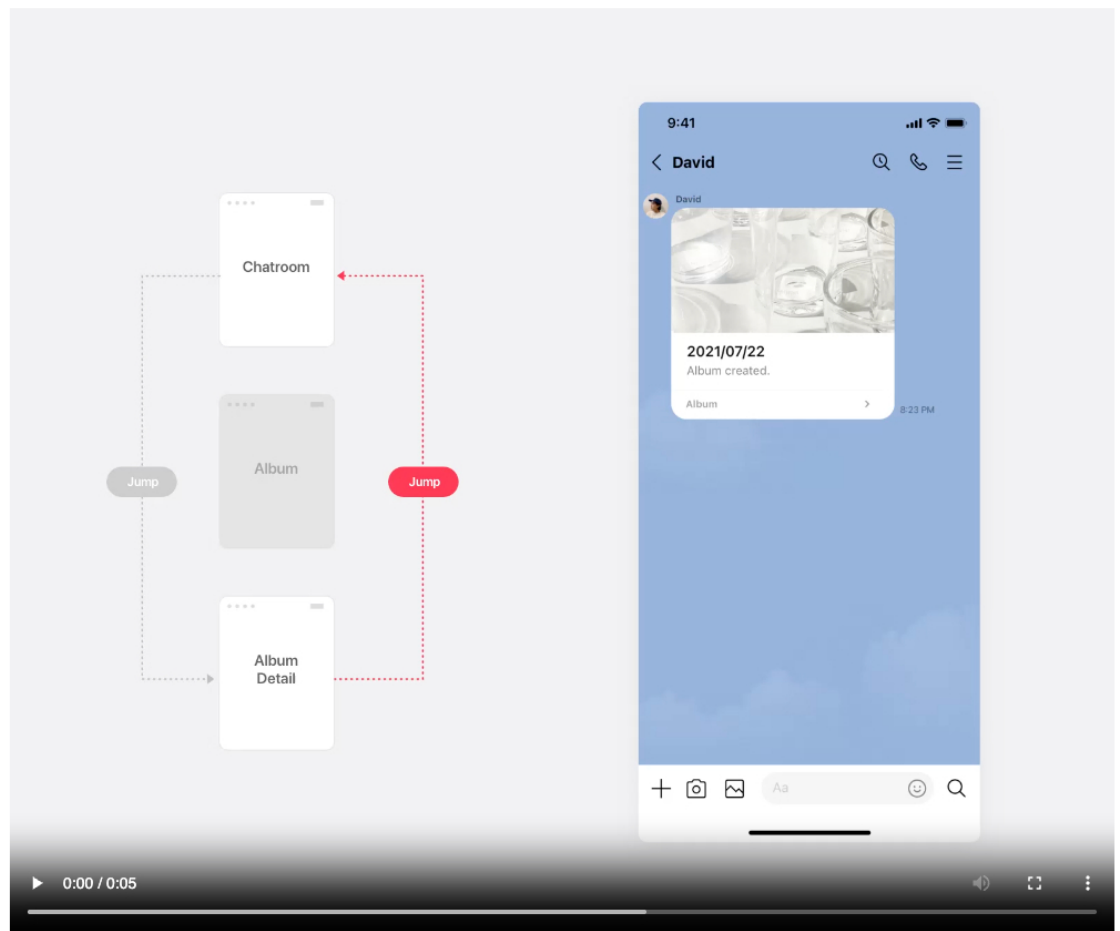

3-1. Reverse chronological navigation

'Reverse chronological navigation' means that the user navigates through the history of the most recently viewed screen in reverse order. For example, the 'Back' button on a web browser is a form of reverse chronological navigation.

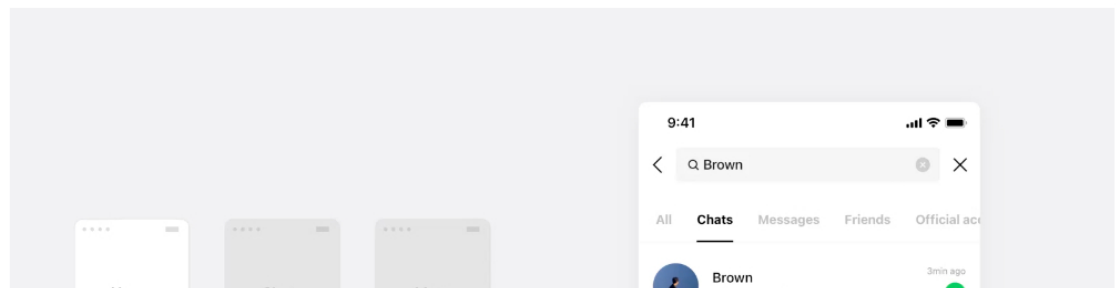

Android back button, iOS swipe to the right from the edge

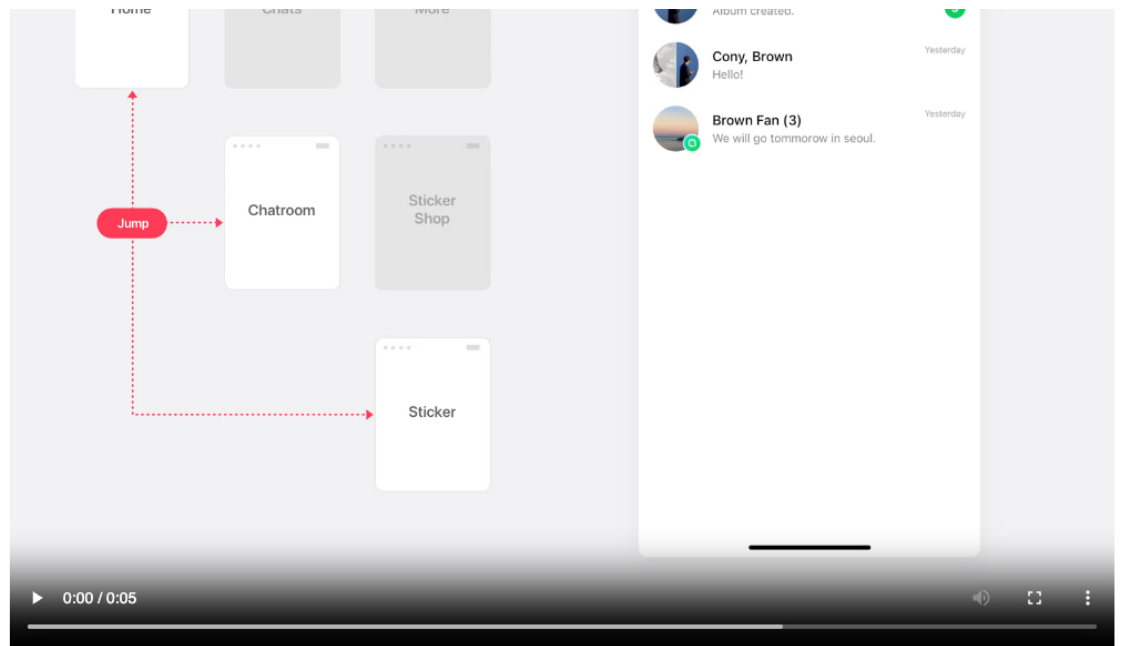

The back button on the Android OS is always provided as 'Reverse chronological navigation'. In iOS, 'Reverse chronological navigation' is always available when sweeping from the edge of the screen.

Back button after direct forward navigation

If the screen is in the original layer flow when you directly enter 'Direct forward navigation', the 'Back' button is provided as a 'Reverse chronological navigation'.

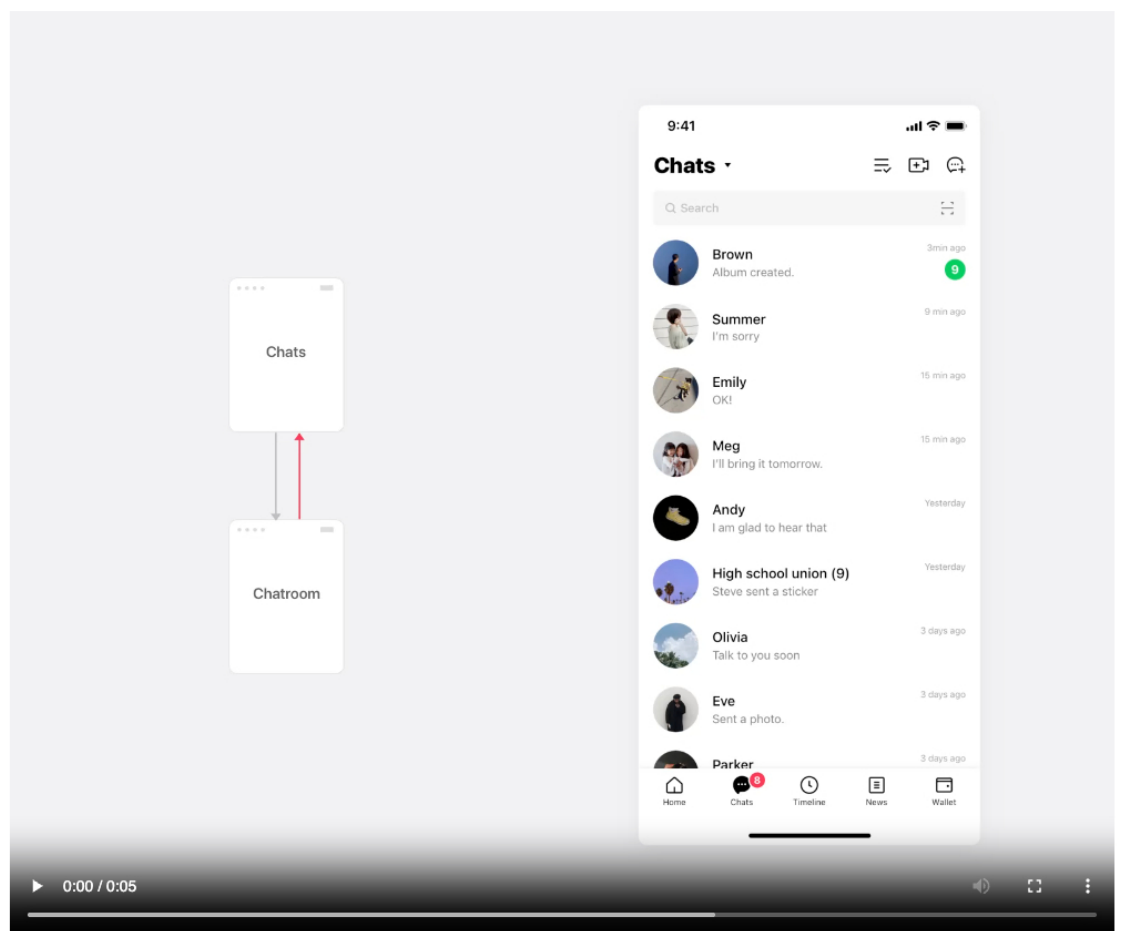

Close button after jump navigation

The close button is always provided as a 'Reverse chronological navigation'!

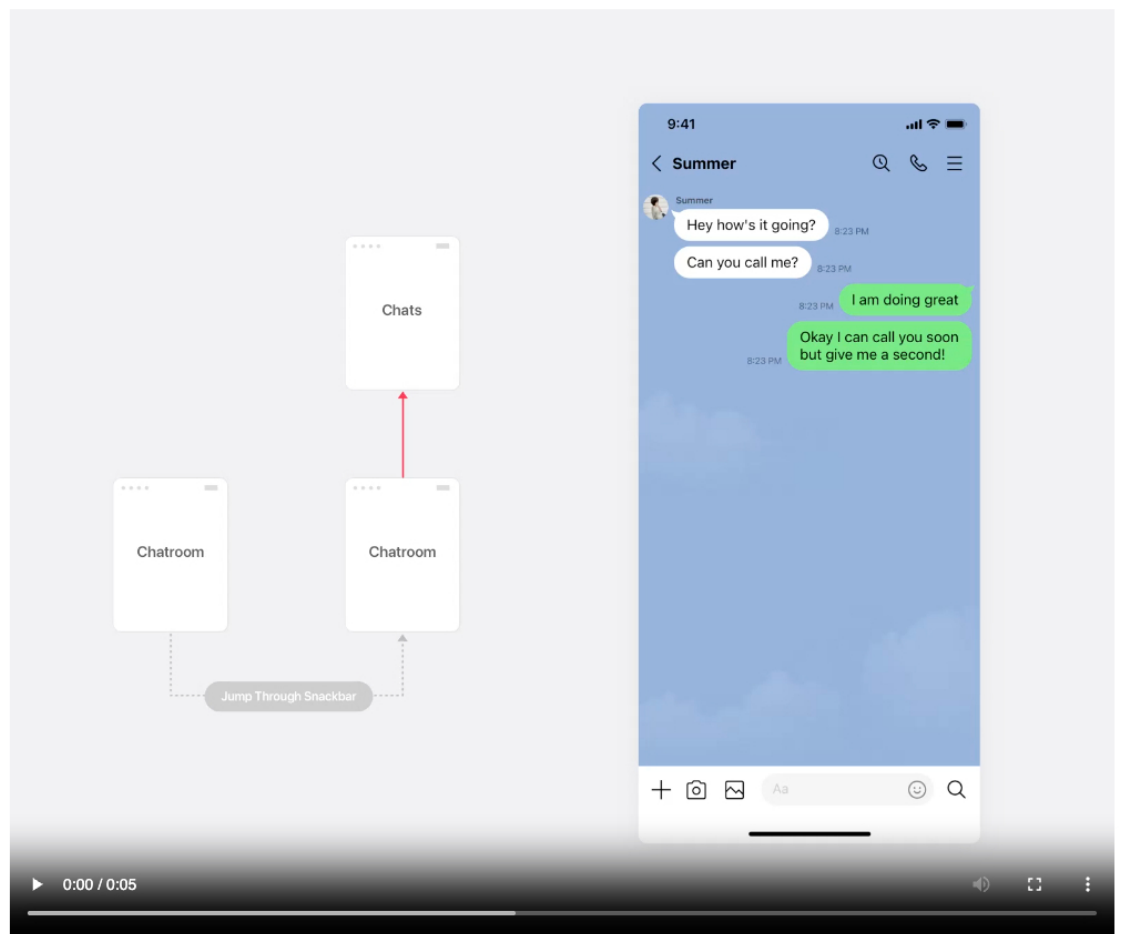

3-2. Upward navigation

'Upward navigation' allows the user to navigate from the current location to the top menu and reach the top navigation. 'Upward navigation' should be implemented for all menus under the main navigation of the app and should be specific to each platform. Android should use Material Up Action, and iOS should use the 'Back' button in the navigation bar.

Back button after hierarchical forward navigation

After entering 'Hierarchical forward navigation', 'Back' button is provided as 'Upward navigation'.

Back button after jump through snackbar

When navigating through the Snackbar, the user jumps over the menu structure in between and enters the screen directly. Therefore, the 'Back' button is provided as 'Upward navigation'.
