Page Indicator

Guide the total amount of information and the point that a user currently belongs to using number or sign (dot, line). Let users acquire information without confusion and use the service smoothly by informing them of the amount of information provided and the user's current point.

Anatomy

1. Activated dot

This is the page the user is currently looking at.

2. Inactive dot

This is the page the user can see by swiping.
You can display up to 10 pages as inactive dots.

3. Ellipsis dot

Use if there are more pages than the number of dots in the ellipsis dot direction.
You can use up to seven dots on the screen if ellipsis dots are used.

4. Background area(Optional)

Use if distinction from the background is necessary to increase the readability of numbers.

5. Current page

This is the page the user is currently looking at.

6. Total page

This is the total number of pages.

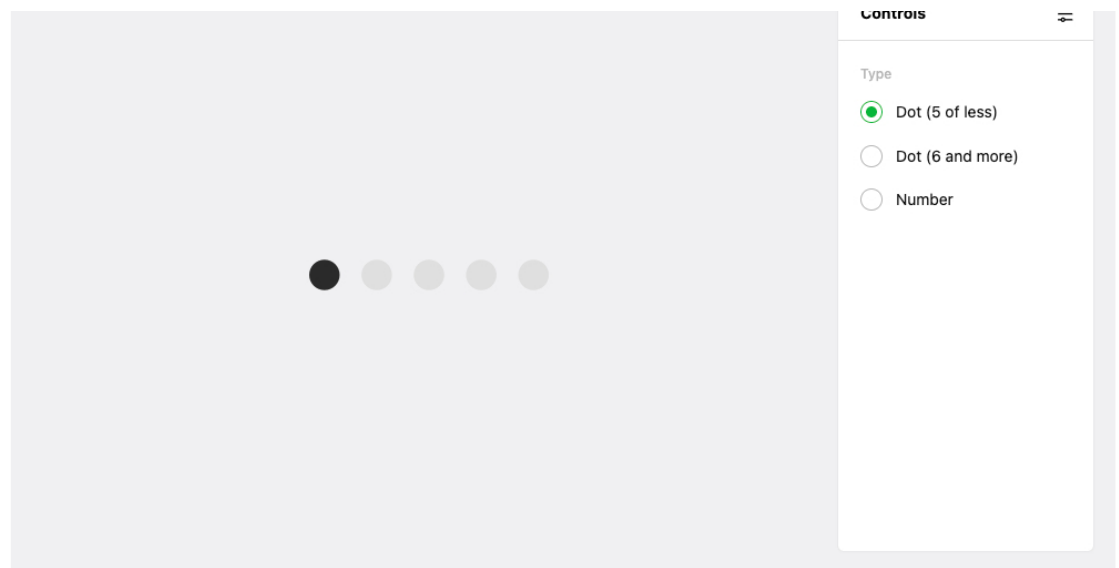

Types

The maximum number of the pages controlled and the UX rule are divided according to the component type.

Light

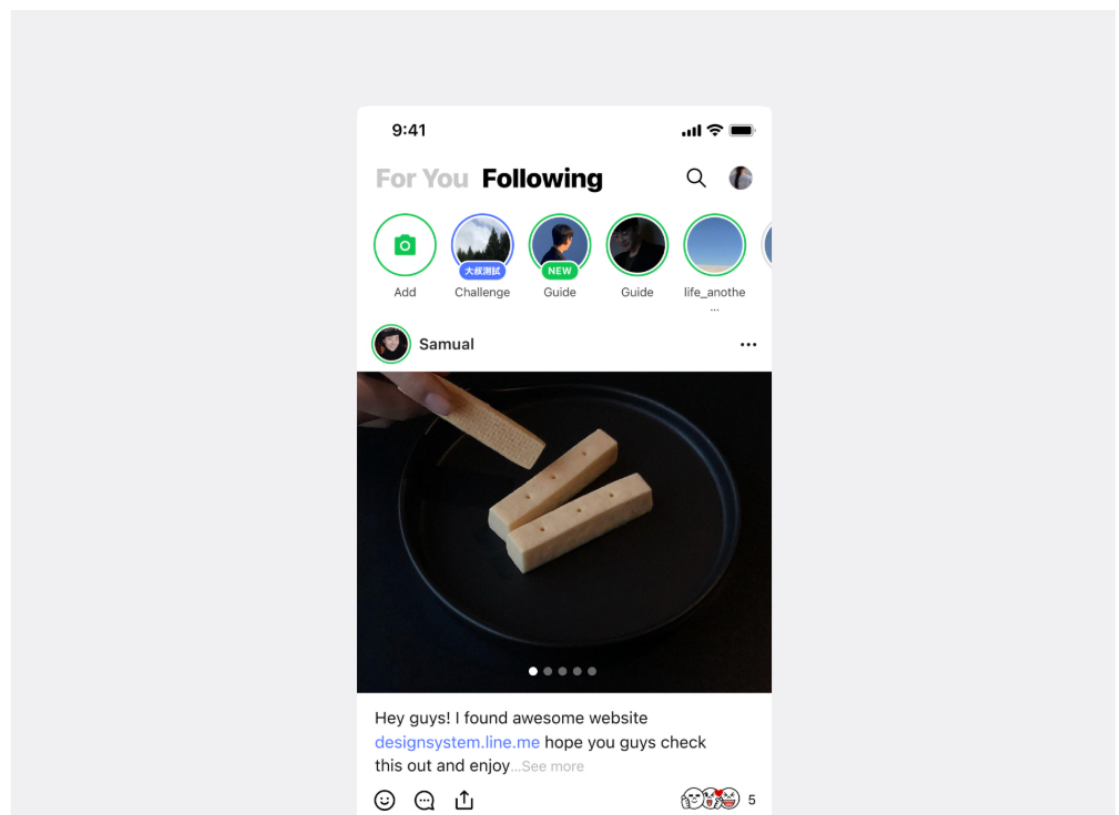

Dark

Overlay

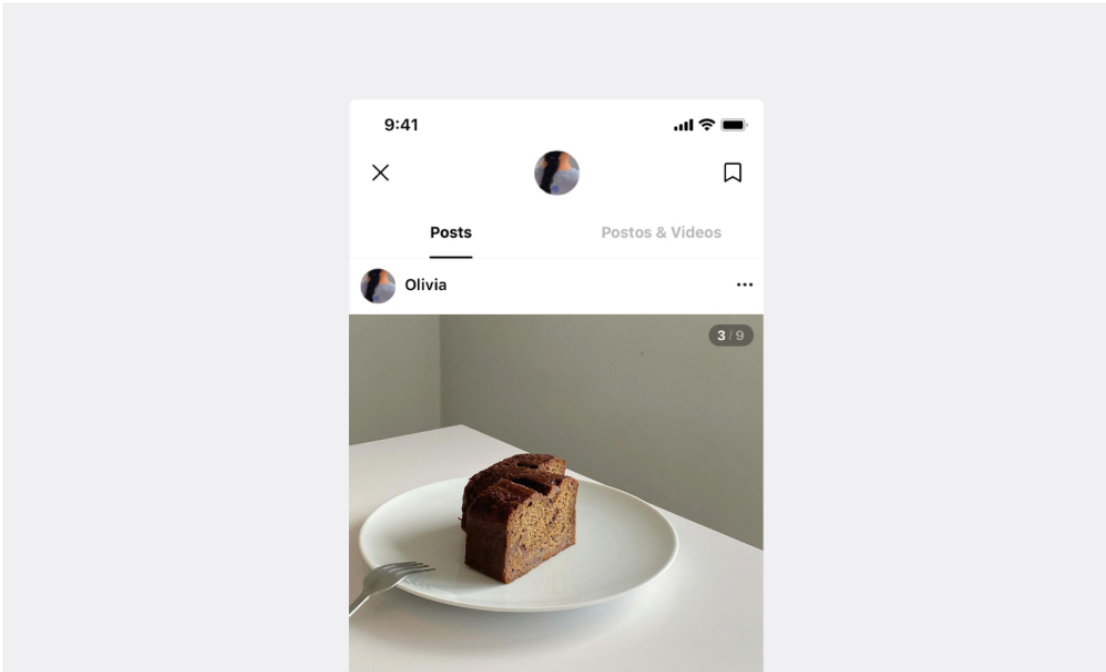

- Use a dot type if there is low user involvement and providing accurate information on the number of pages is not required while skimming content.
- Use a number type if detailed information on the content must be provided and the number of pages must be clearly provided due to high user involvement.

Dot Type

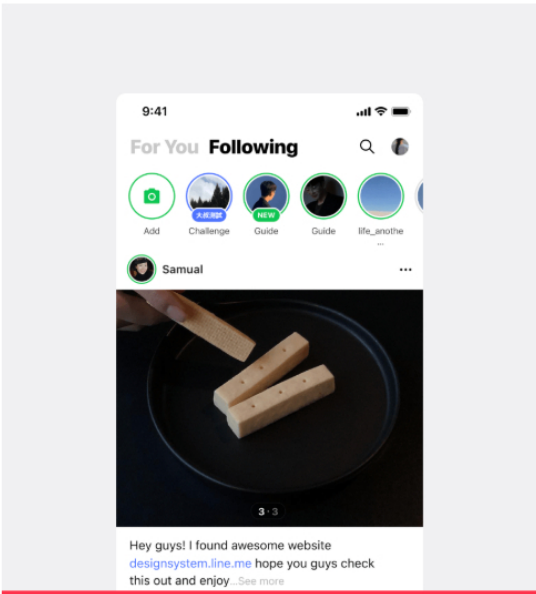

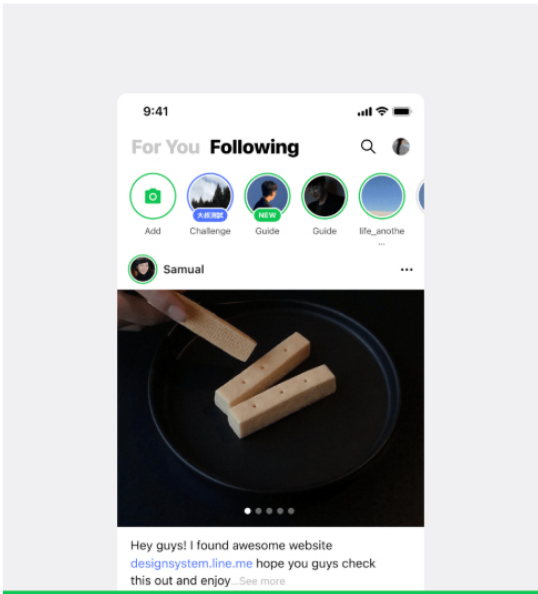

When	You can easily pass on the fact that there is more information after turning over the page to users. This type is inappropriate if it is important to provide an accurate amount of pages.
Exposure Point	Expose at all times.
User Involvement	Low Skimming content
Complexity	Low It is even easier for users to recognize. Use when you want to simply provide information that "the content is provided as pages."

Number Type

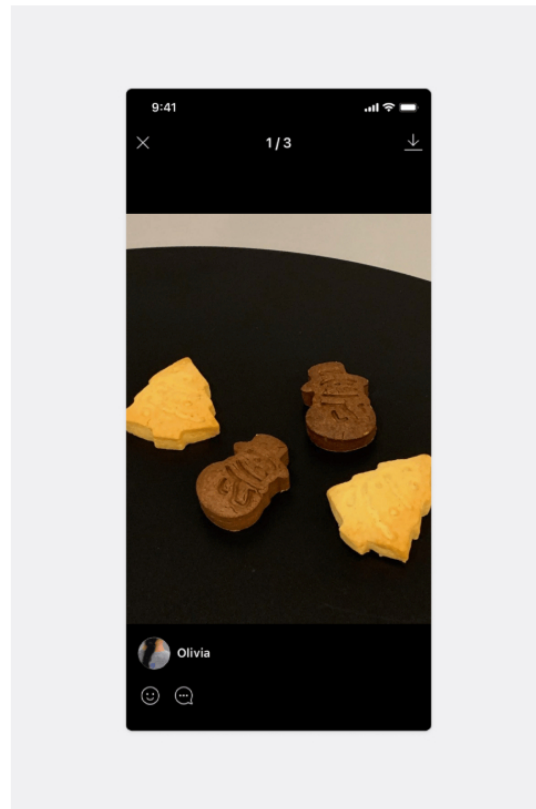

When	Use when you must provide accurate information on pages.
Exposure Point	You can expose at all times or according to a specific rule.
User Involvement	High When users need a detailed information as upload or the related content
Complexity	High Complexity is higher than the dot type because a detailed information is provided.
Examples	Photo in detail view

Do & Don't

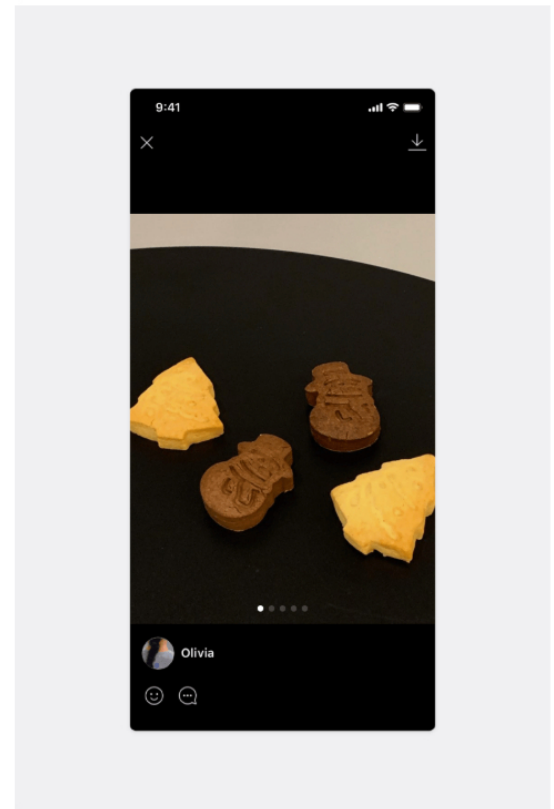

Do

In a LINE VOOM with a variety of information, provide the page information briefly and intuitively with the dot type.

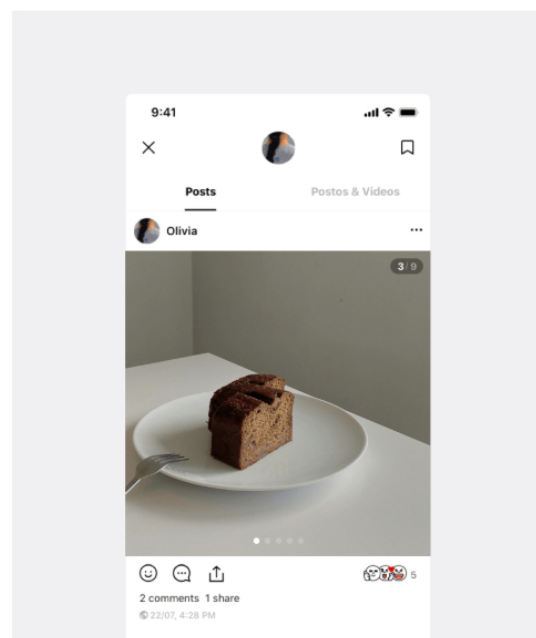

Don't

Do not increase complexity by providing it as a number type.

Do

In a page to view content in detail, provide the page information in detail also.

Don't

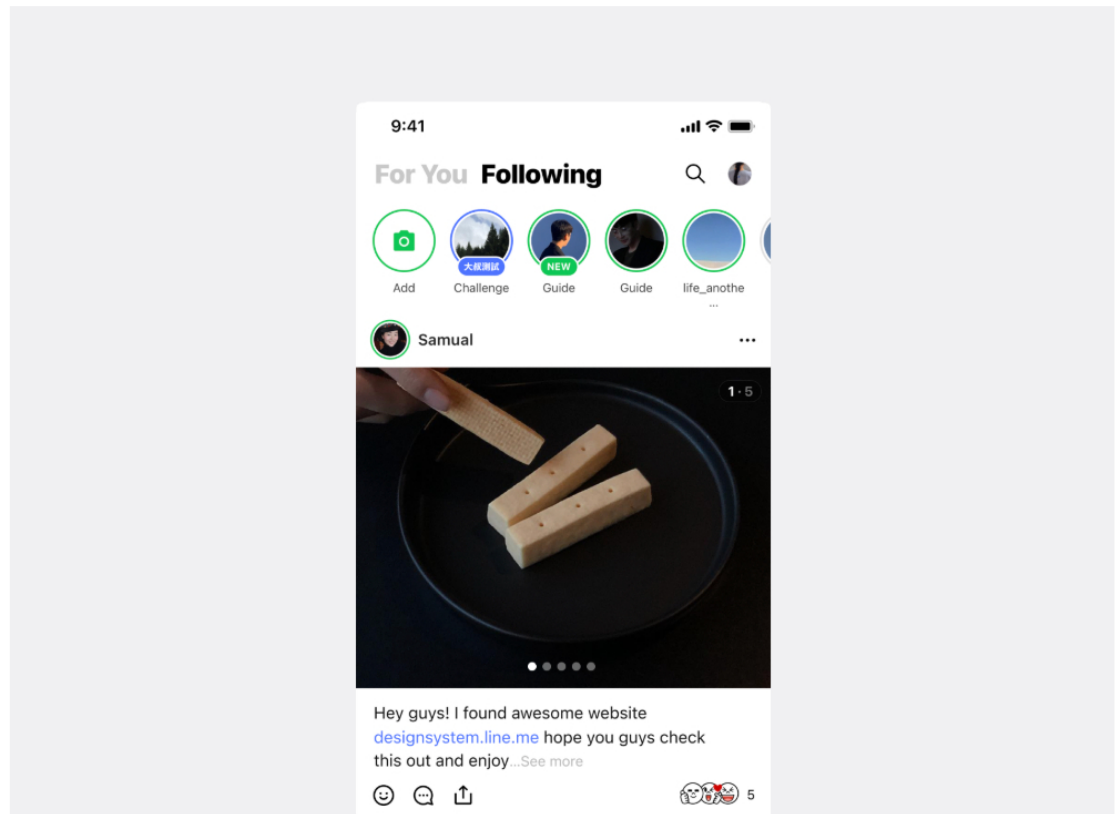

The dot type is inappropriate if clear page information is required.

Caution

A number type and a dot type can be used together. In this case, the number type is exposed temporarily according to a specific rule.

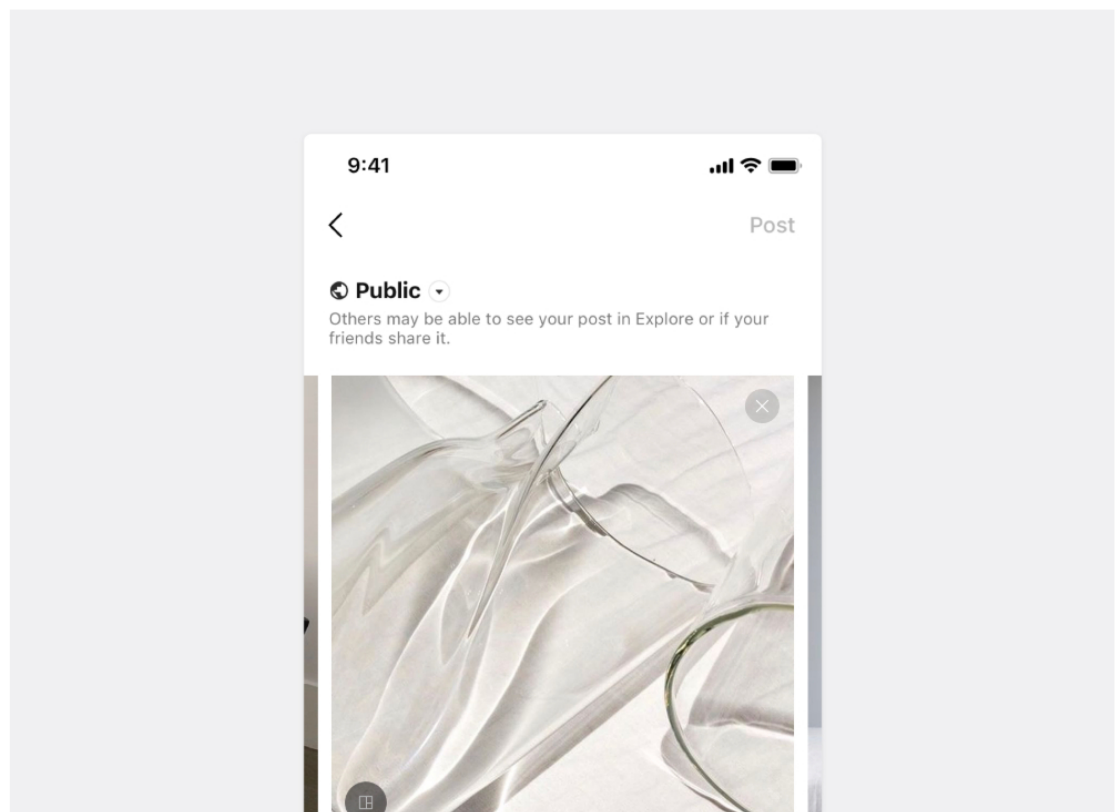

Usage

Inner Content

You can display page indicator inside content.

Outer Content

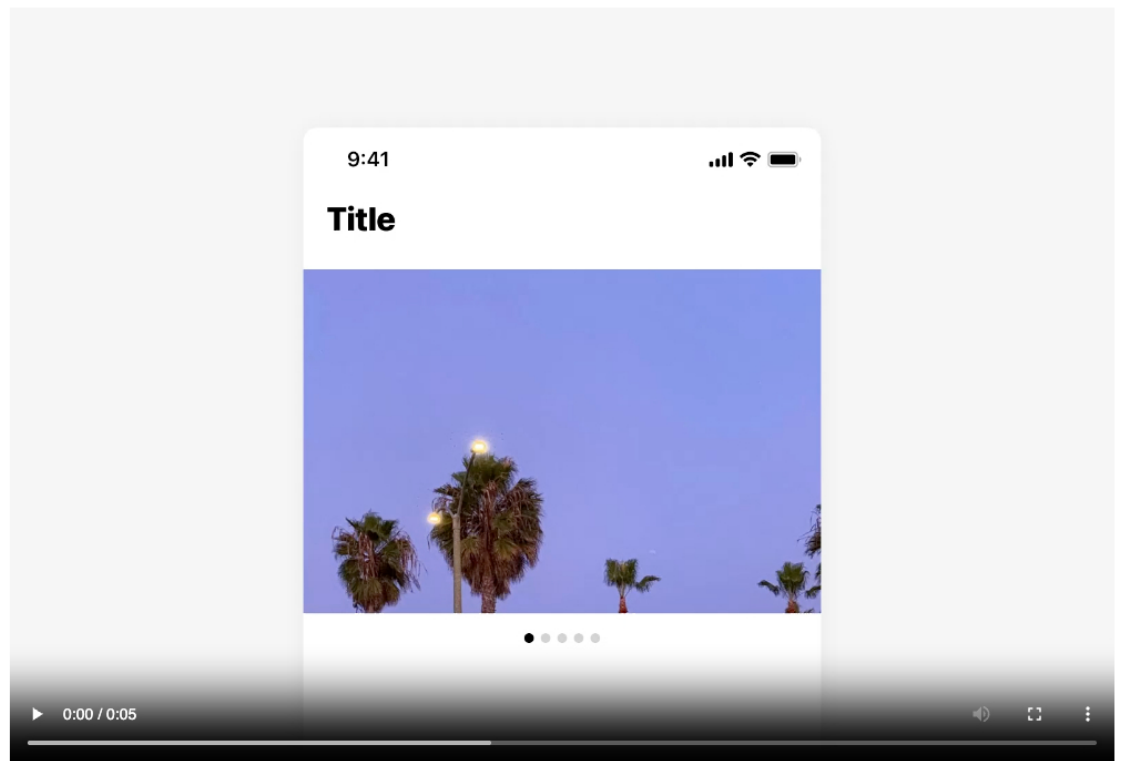

You can display page indicator outside of content.

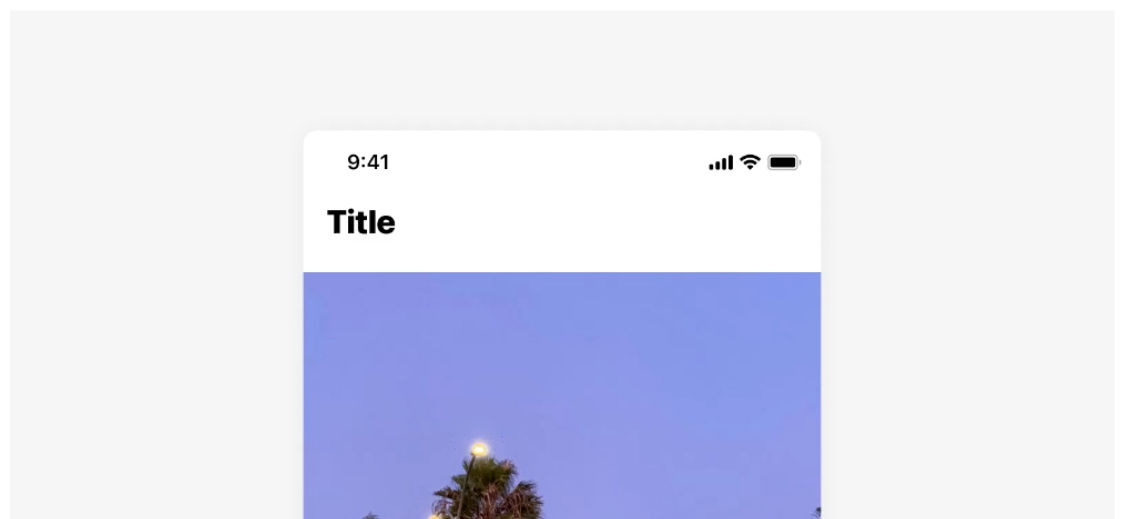

Interaction

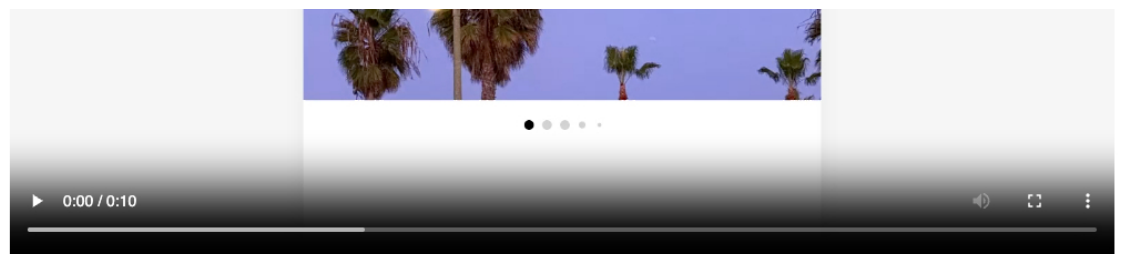

The maximum number of dots and the placement sequence must be same as the interaction. A detailed movement interaction can be customized for each service. Redirect the page when more than 50% of the screen is swiped.

2-5 Pages

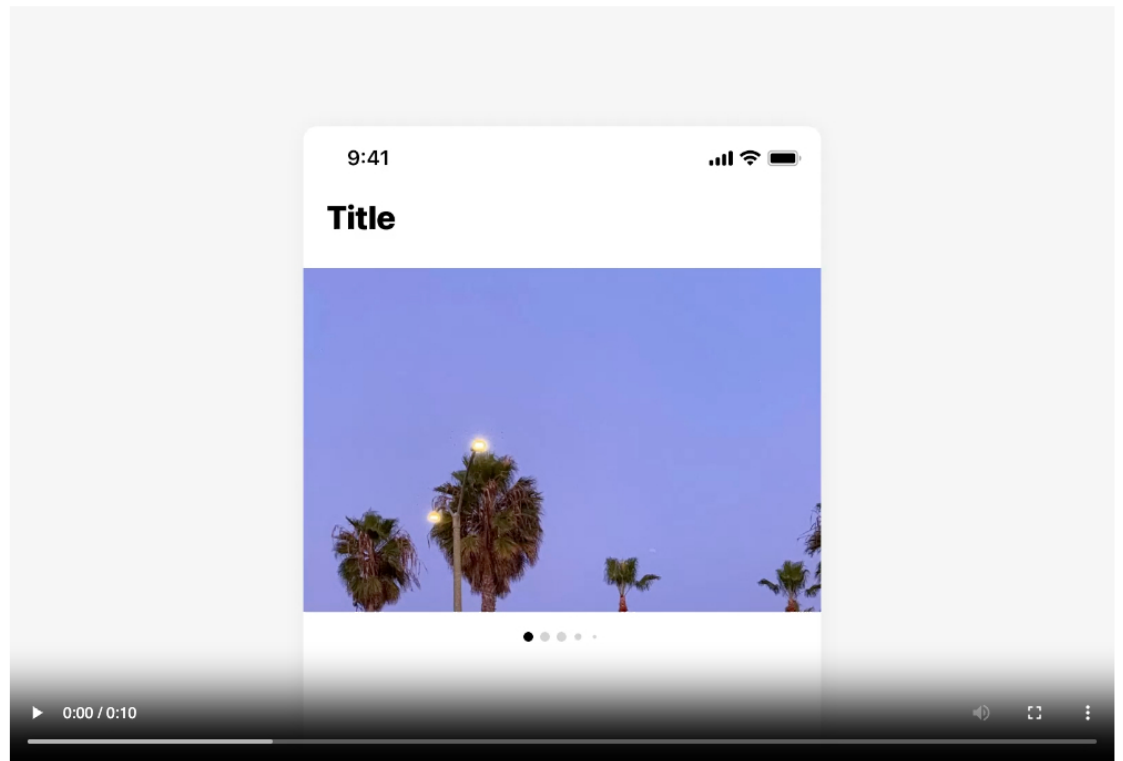

6 Pages

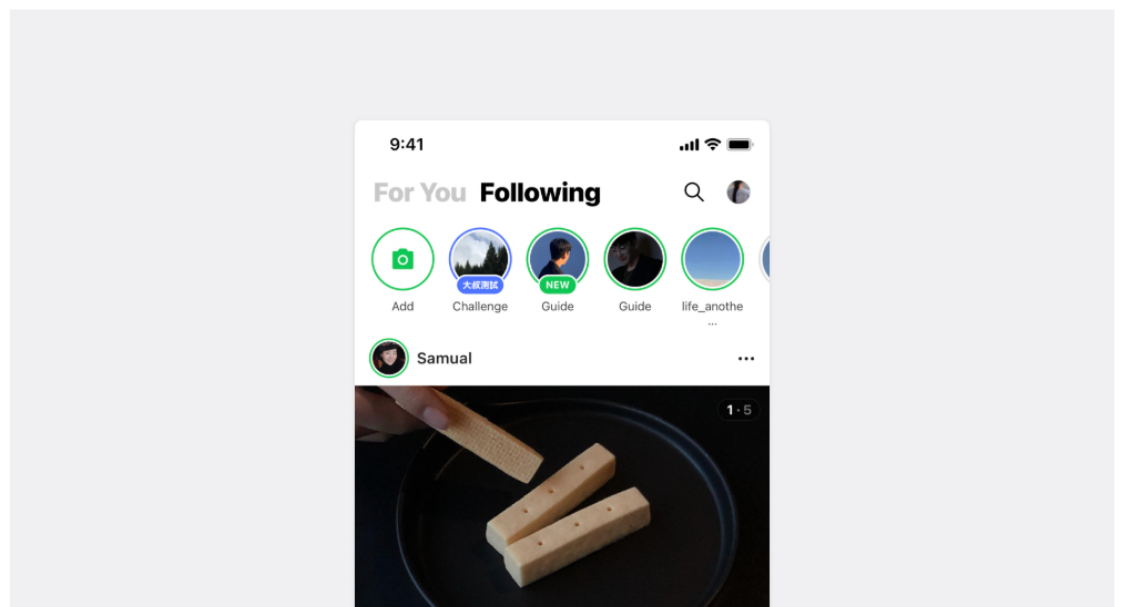

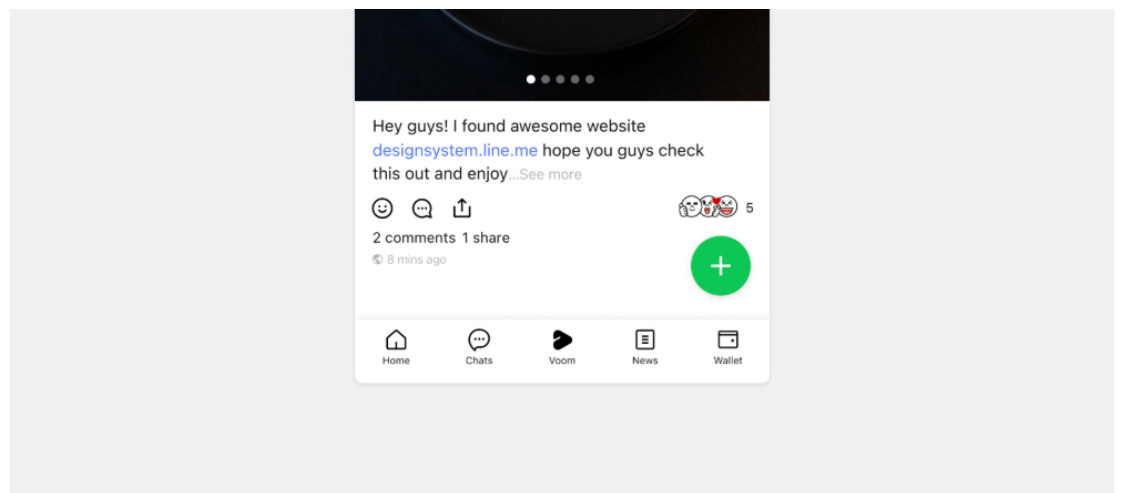

7-N pages

Placement

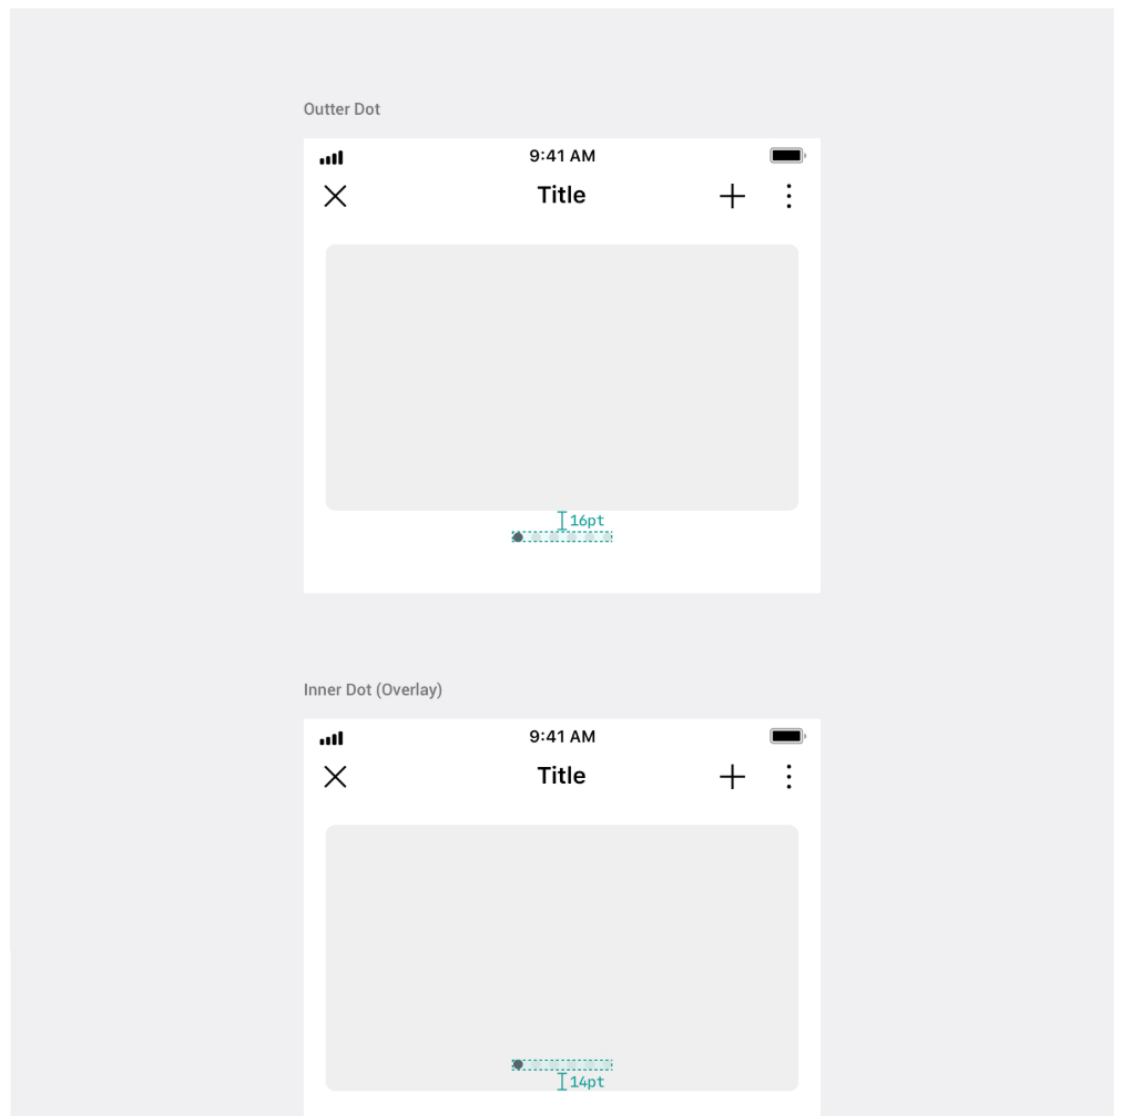

- Place so that both the content and the additional information are clearly visible.
- Place so that the page indicator does not interfere with the content.

Layout

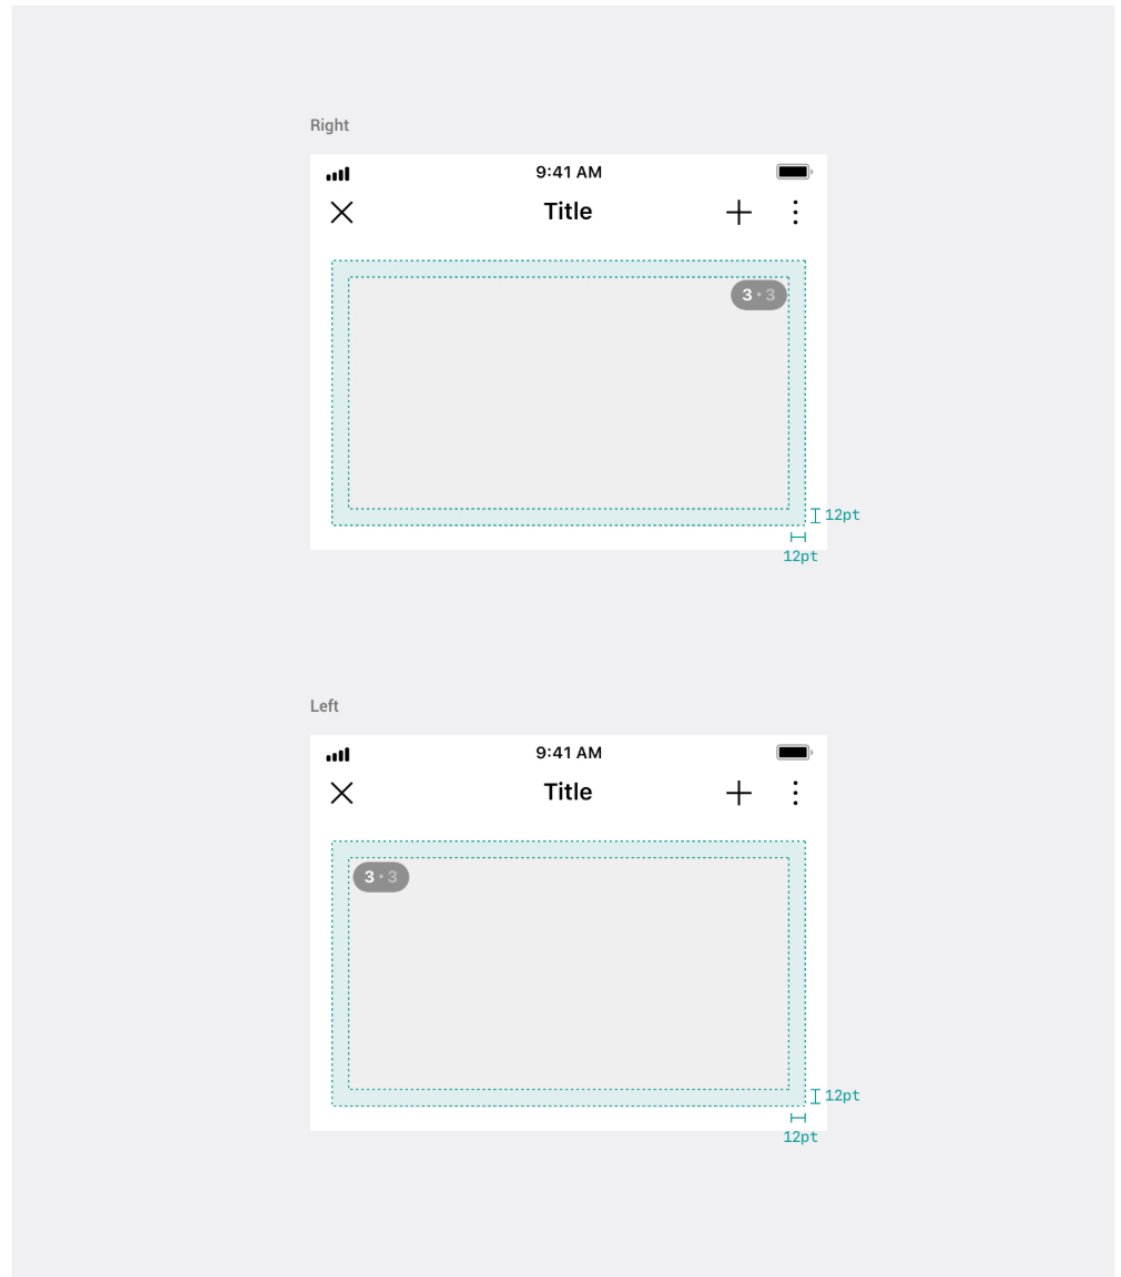

Dot Type

Request design QA

You may place it inside or outside a content which contains paging. Design QA is required because the placement of page indicator is not fixed and the margin at the bottom is not included in the component.

Number Type

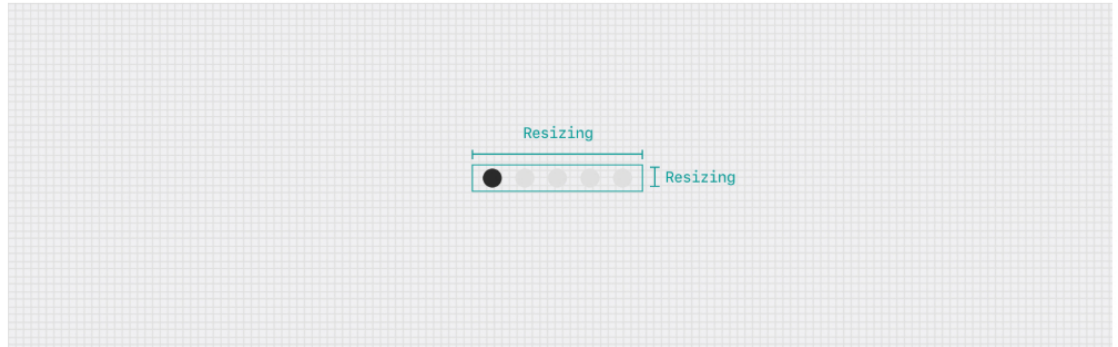

Request design QA

You may place above a content which contains paging. Design QA is required because the placement of page indicator is not fixed and the margin is not included in the component.

Design spec

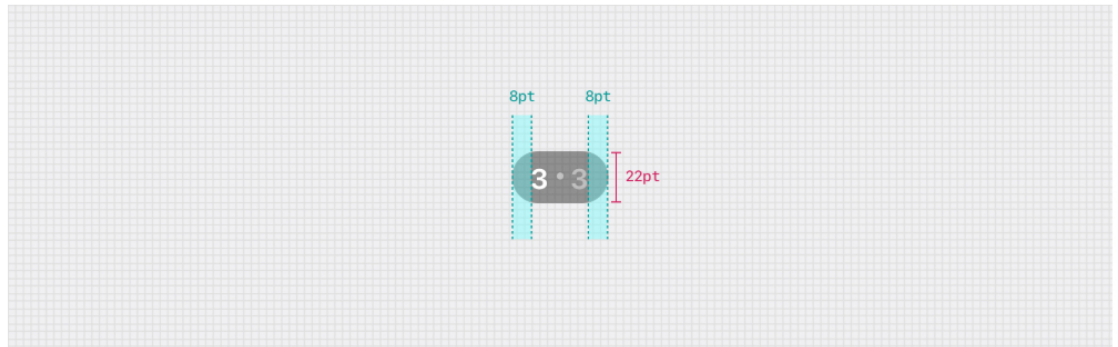

The dot type page indicator has a part that allows customization.

Dot Type

In general, the dot type page indicator maintains small and large sizes as they were originally. In exceptional cases where size adjustment is required, use the scale feature to resize without having the symbol detached in the sketch. If the size has been adjusted, additional design QA is required.

Number Type

Since designers cannot adjust size of the number type page indicator at their own discretion, select either a small or large size. The design QA on the component itself is not required because customization is not possible.
