Search Bar

Users can use the search bar to quickly find the information provided by the app. "Search bar" refers to a field component for entering a search query.

Anatomy

1. Icon area

The icon represents the functions to recognize search instantly.

2. Text area

The text area is for entering search keywords.

Placeholder: This is a phrase exposed by default before entering text. You can expose a hint text to guide the search.

Query: This is the text entered for search.

3. Reset button area

This button is exposed if a word is entered in the text area. If selected, the text area will be reset. (A state of being focused at first without any entered word)

4. Cancel button area (Optional)

The button is displayed when focused on, and the search task will be canceled if Cancel is selected.

5. Search option button area (Optional)

This is an area to display the buttons to execute the optional features to input search other than text input, such as voice search and QR code scan search.

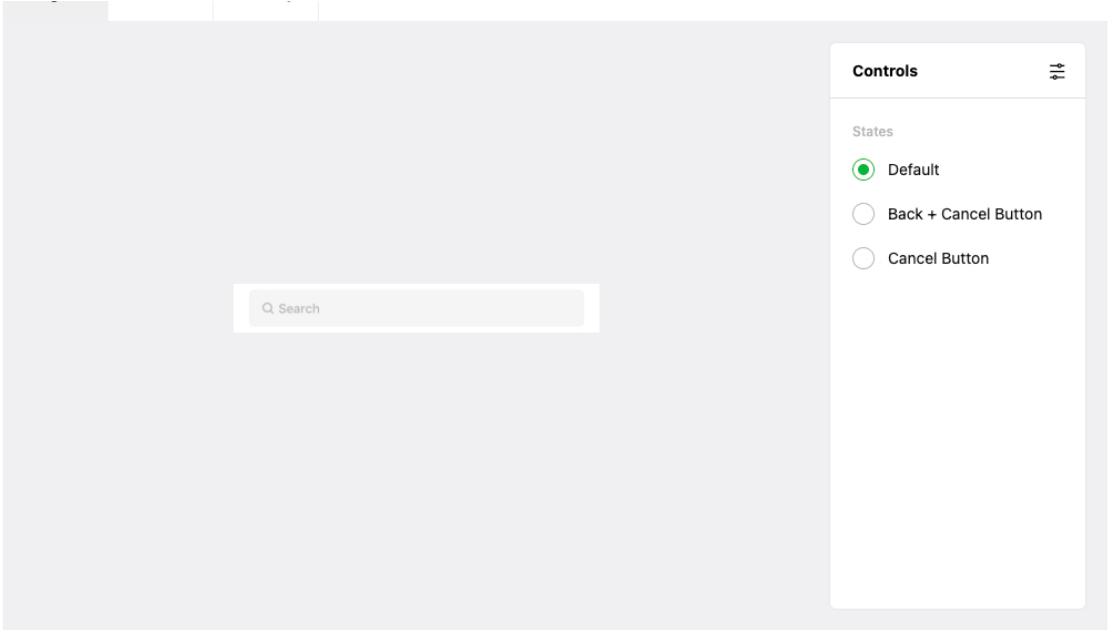

Types

In LINE Design System, a single search bar is provided as a component. You can use the search bar according to the three search types below.

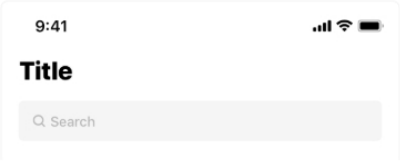

Light

Dark

Overlay

4Top search bar

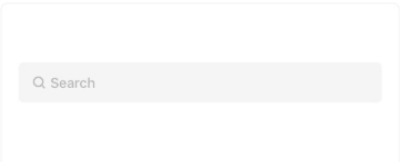

This type must be used together with the top navigation.

Contextual search icon

The search bar is in a hidden state at first and the environment to execute search is provided when the icon button is selected.

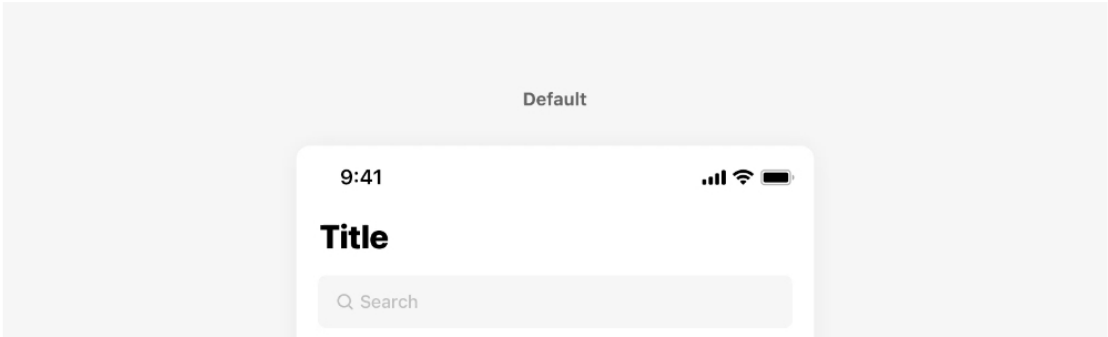

Module search bar

Use this type to apply to the required area on the screen, without exposing the search bar, to a fixed location.

Usage

Top search bar (general use)

Focused

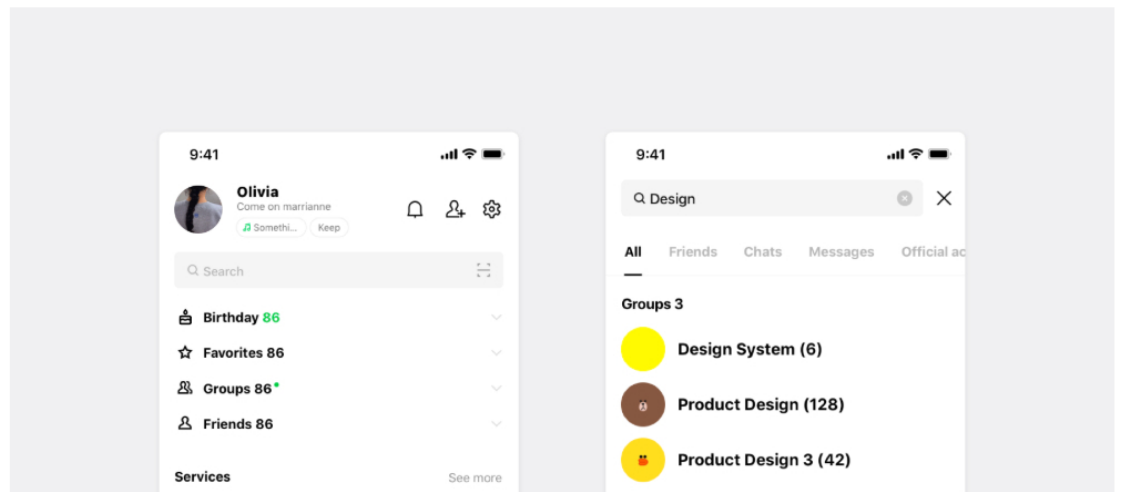

The input area will be focused if search bar is selected.
The search history of the user may be exposed in the body text area.

Entering query

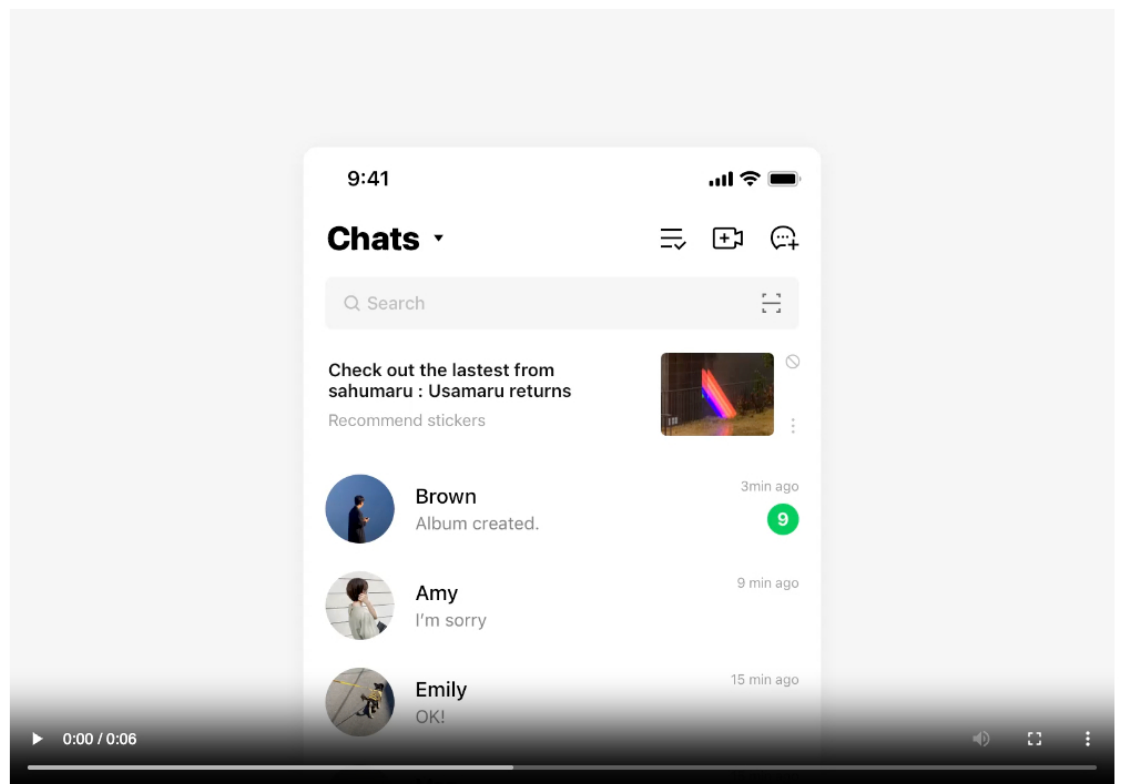

If a keyword is entered, a list of recommended keywords may be exposed below the input window.
When the Cancel button on the right is tapped, the search will be canceled and it will return to the default state.

Submitted

Search results on the query displayed in the search bar will be exposed below the search bar.
When the Cancel button on the right is tapped, the search will be canceled and it will return to the default state.

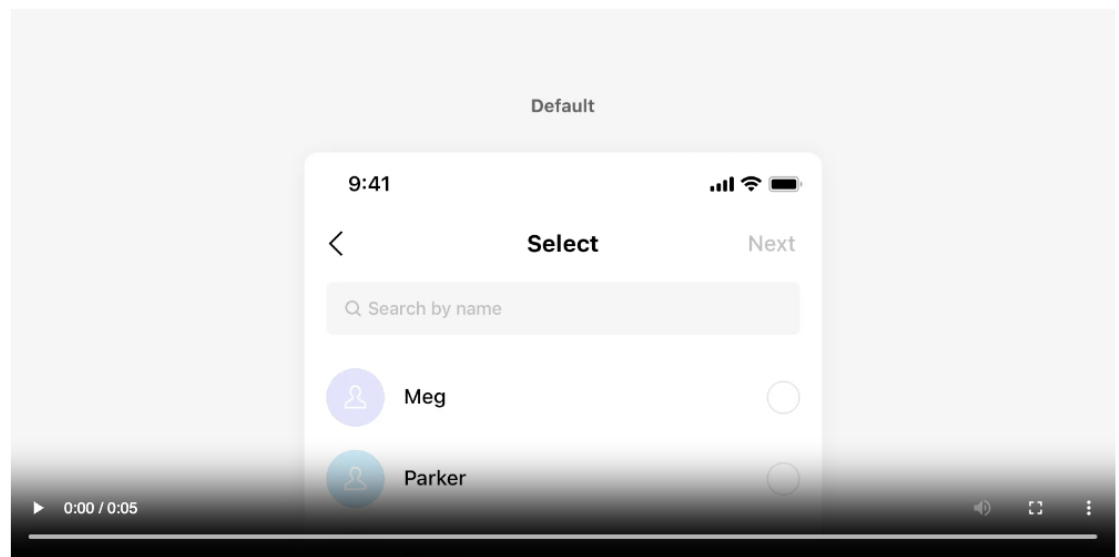

- Users can find the search function immediately and execute the search function instantly because the search bar is exposed at the top area of the screen.
- Users are able to use search bar to quickly access various types of content information and chat rooms, etc. provided by the app.

If the body text area is scrolled up in the default state, the search bar may be hidden to make the content below the body text easier to see and will be exposed again if the screen scrolled in the opposite direction.

Top search bar (selection mode)

Focused

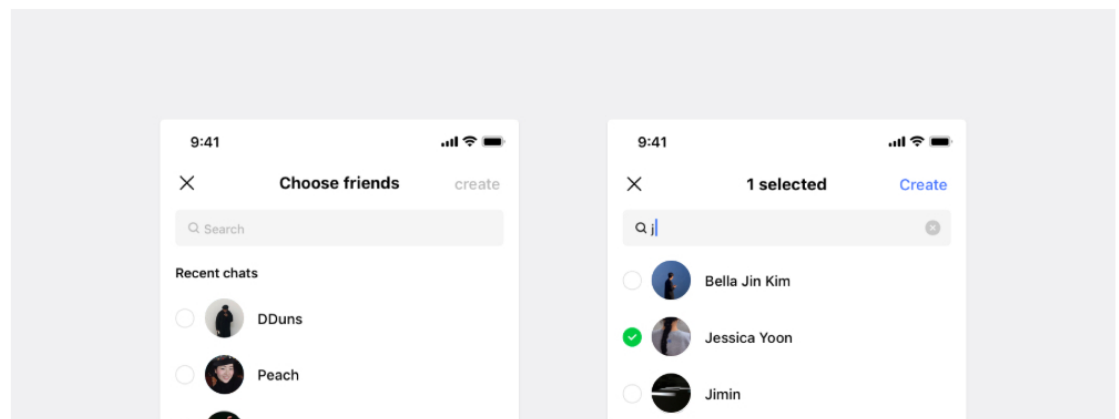

The location is fixed to the same location as the default search bar.
Cursor and keyboard are exposed to enable direct input.

Entering query

The instant search results are exposed below the input window once the user starts to enter a word.
If the item is selected right away, only this item changes to the selected state without deviating from the screen.

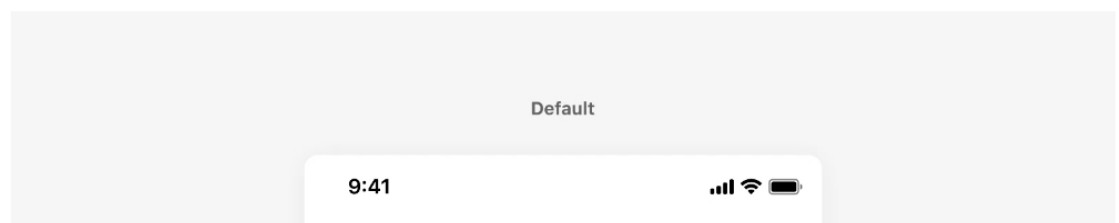

Submitted

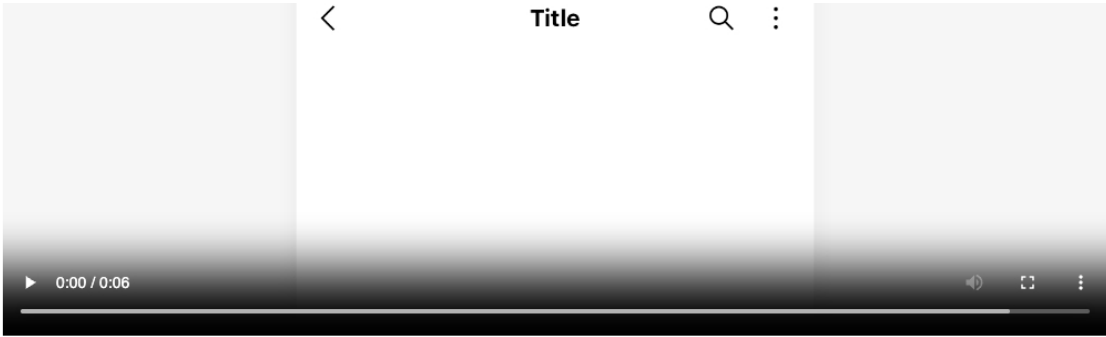

This is a state of pressing Enter on the keyboard after entering a keyword in the search bar.
When the Reset button is tapped, it will go back to the focused state.

- A separate Cancel button on the right side of search bar is not provided even in the focused state. That's because it doesn't just control the search function separately due to the nature of the editing mode.
- If the Cancel (Back) button of the top navigation is tapped, the selection mode will be canceled and it will exit.

Contextual search icon

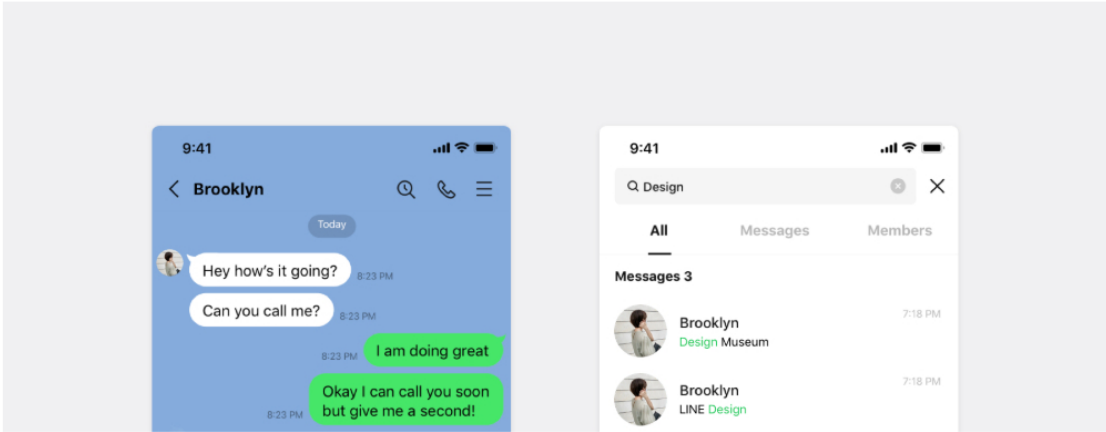

Focused If the Search button is selected, the top navigation will switch to a search bar.
At this time, the search bar is in a focused state and the search history may be exposed in the body text area.

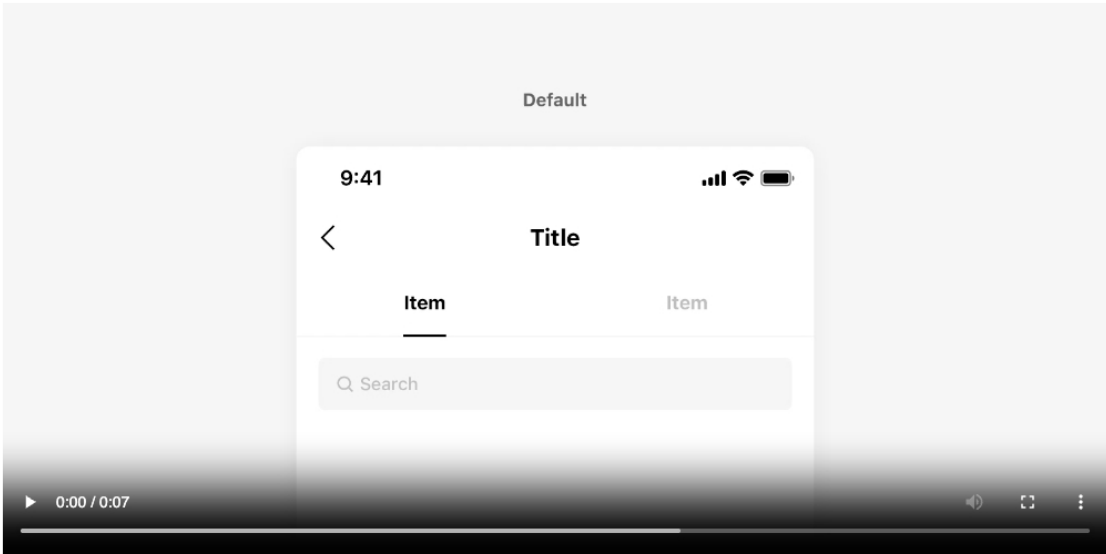

Entering query If a keyword is entered, a list of recommended keywords may be exposed below the input window.
Search is requested by selecting a recommended keyword or tapping Enter on the keyboard.

Submitted The search result on the query displayed in the search bar will be exposed below the search bar.
When the Cancel button on the right is tapped, the search will be canceled and it will return to the default state

This type is available if search is not the main function and also not the action which users must perform repeatedly.

Module search bar

Focused Cursor and keyboard are exposed in order to execute the input.

Entering query The feedback search results are exposed below the search bar when the user starts to enter a word.

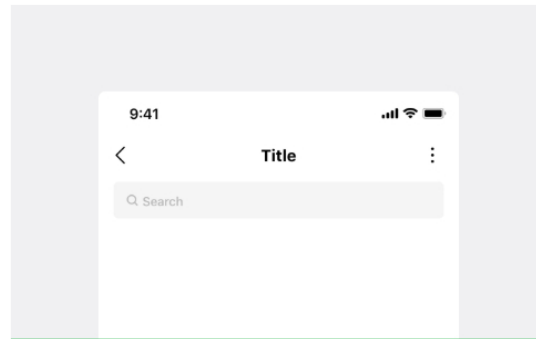

Entering query

The instant search results are exposed below the input window once the user starts to enter a word.

Submitted

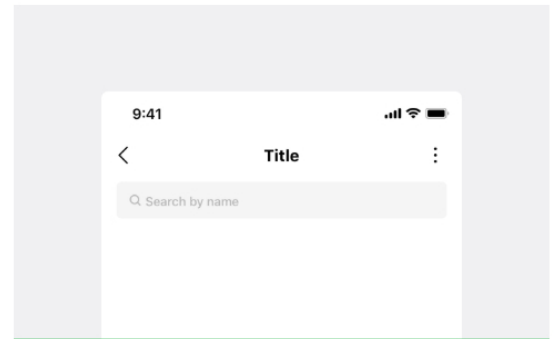

When the Reset button is tapped after entering, it will go back to the focused state.

- Detailed flow of executing search by default from a modular search bar is almost identical to the top search bar.
- Request a usability review by the LINE Design System team on the exceptions where instant search cannot be provided on the modular search bar.

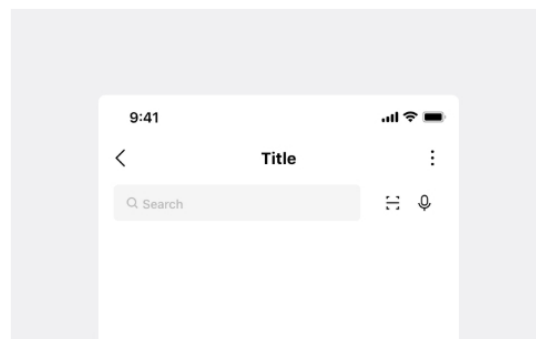

Do

The action name can be a title, or the number of selected items can be indicated in case of selective actions.

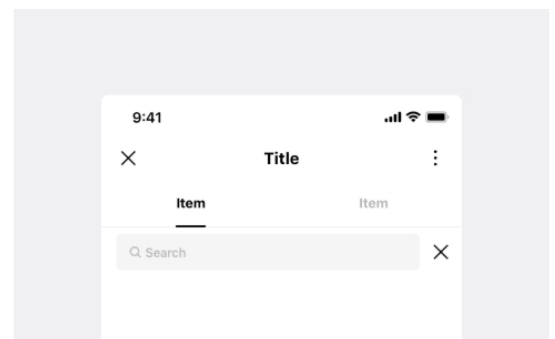

Do

Avoid underlining the title because it declines clarity and also can cause misunderstandings.

Don't

The action name can be a title, or the number of selected items can be indicated in case of selective actions.

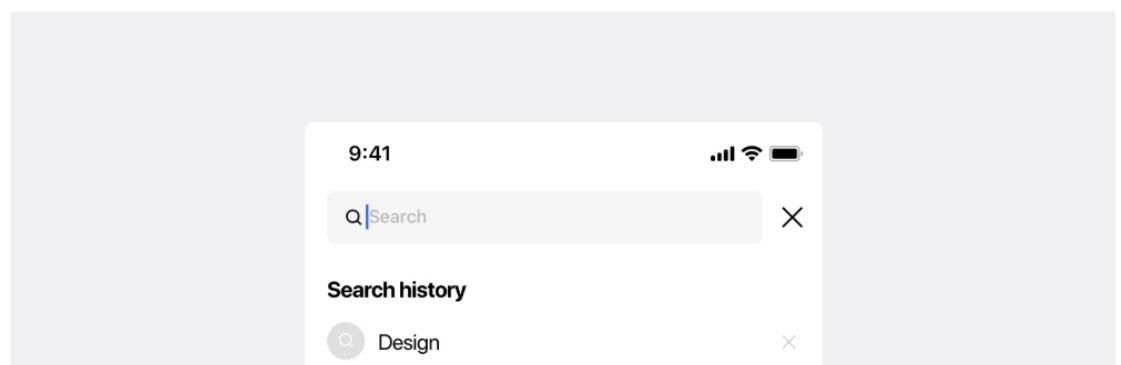

Don't

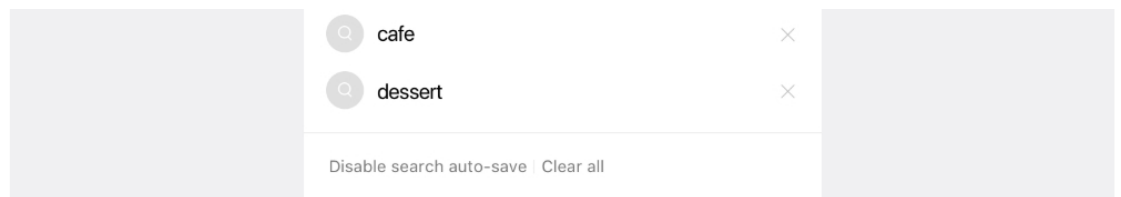

Avoid underlining the title because it declines clarity and also can cause misunderstandings.

More search pattern

You can provide an auxiliary optional feature of search to help users find the desired results quickly and conveniently during the search.

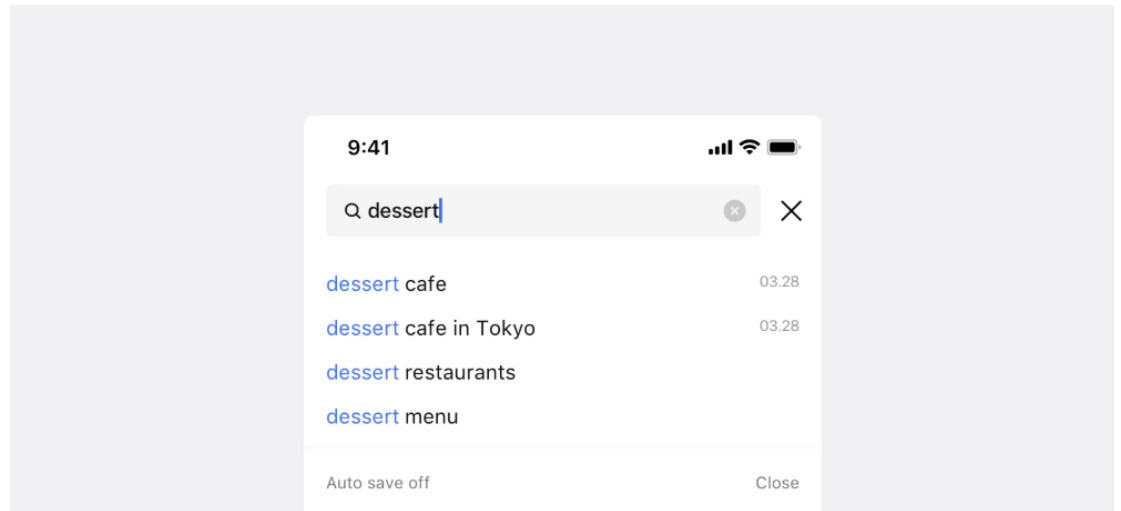

Search history

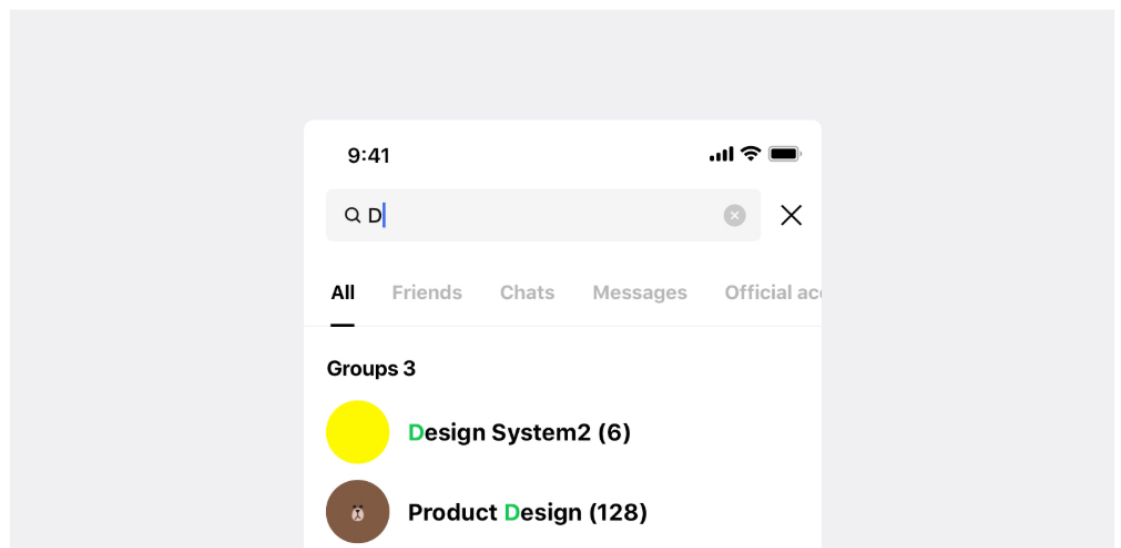

- The recently searched keywords are displayed when the search bar is focused.
- If a keyword is selected by tapping, the search result is displayed on the body text area as the keyword is input automatically on the search bar.
- Users can turn off the function to save keyword if desired.

Auto complete / Query suggests

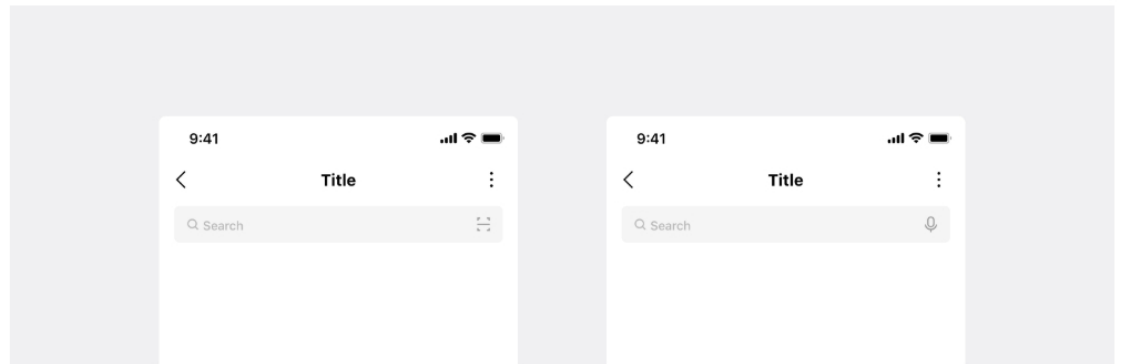

- Auto-complete and provide a recommendation below the search window, including the keyword being entered.
- Highlight the letters being entered with a different color.
- Users can turn off the function to auto-complete the keyword if desired.

Instant search results

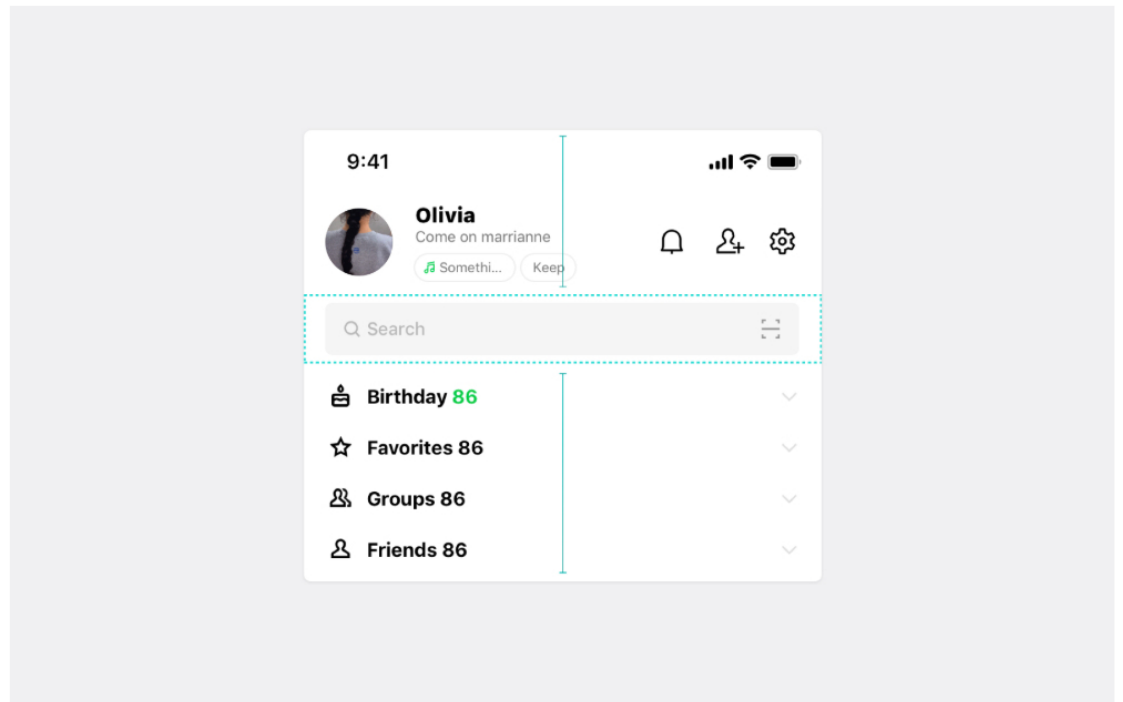

Once the keyword input starts, the result which is same as the query entered by the user or determined to have some kind of relationship among the content that can be provided in the app will be exposed in the body text area.

Voice, QR search

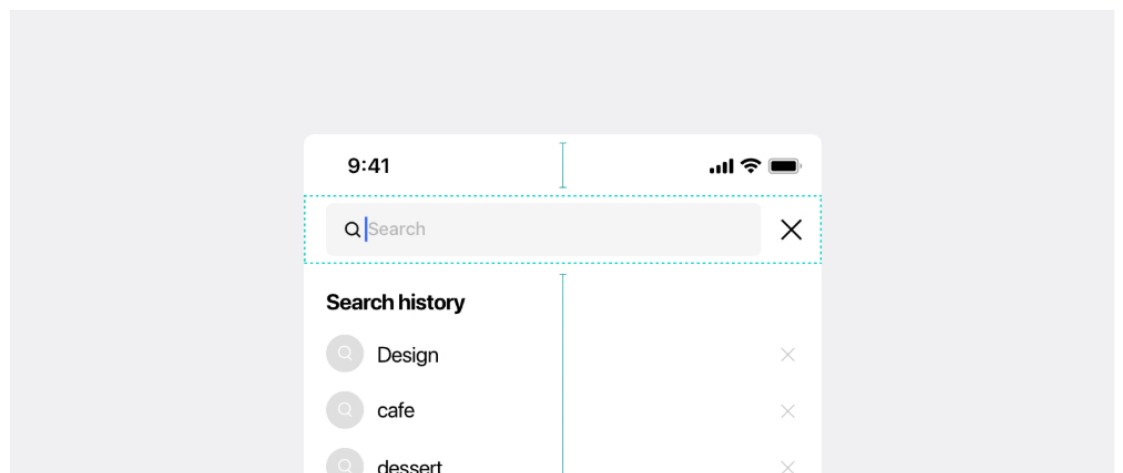

- Icon buttons may be provided on the right side of the search bar field if voice search or QR search is supported.
- When each button is selected, the interface to execute the search will be exposed. (QR search, voice search, or both of these features may be exposed.)

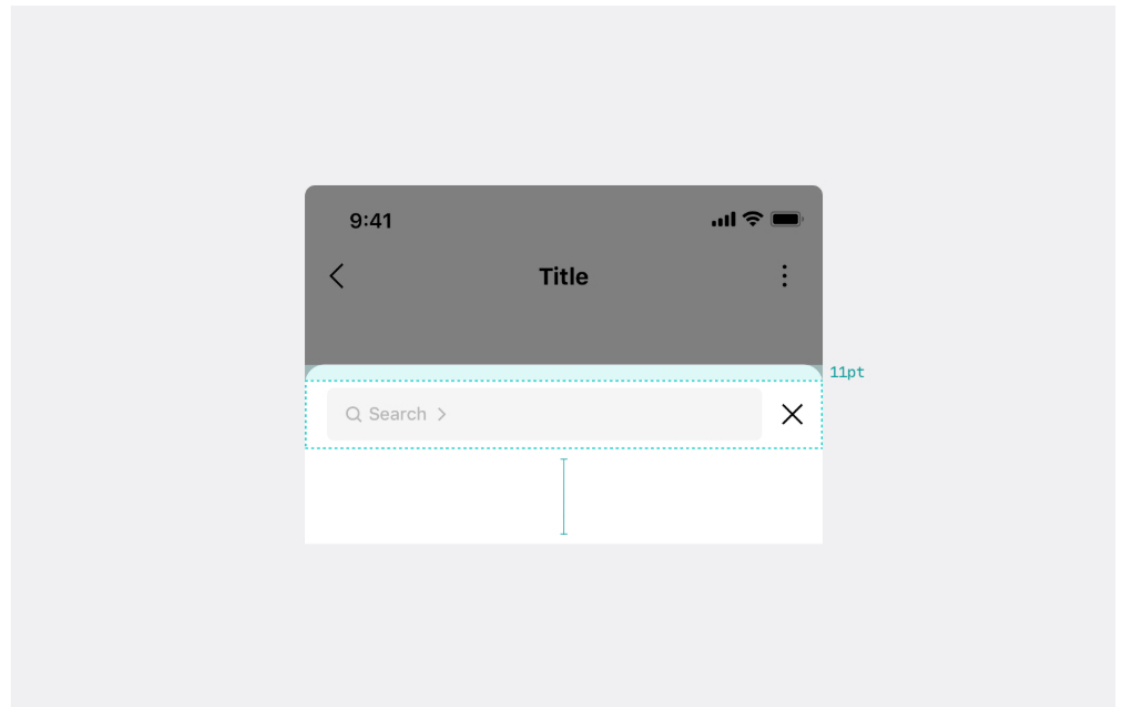

Placement

If search bar is exposed on the screen, it is generally placed below the top navigation.

If search bar is focused in the top search bar or the contextual search icon type, it is located below the status bar.

The search bar can be used in the top navigation area of the bottom sheets.
