Share

Share is the action of sharing good things with friends. Share consists of the following steps:

Share icon

Use respective share icons for iOS and Android. Design to the characteristics of the platform as much as possible so that the user can quickly recognize the feature.

iOS SHARE ICON

ANDROID SHARE ICON

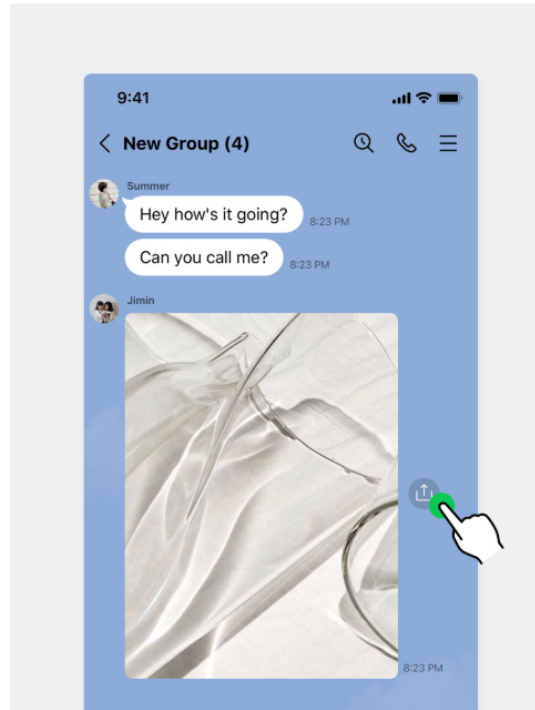

Iconography

For more information, please click [here](#).

Share entry point

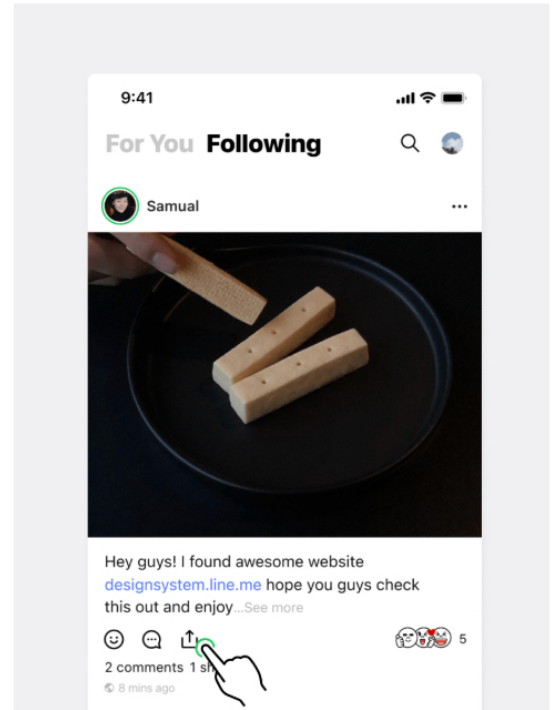

The placement of the share icon should relate to the type of content intended for sharing. Based on the primary action provided on the page, use the following:

Beside contents

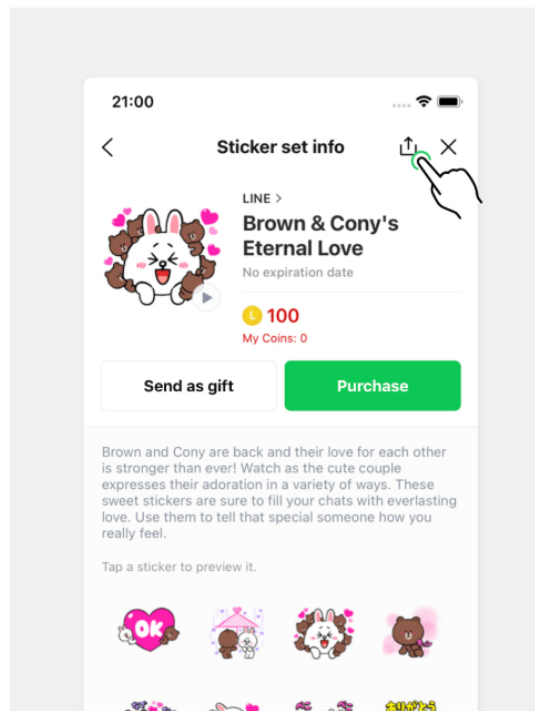

When sharing content, provide the entry point visibly near the content, so that it can be easily and quickly shared.

Inside contents

Share via a share button located next to the content chat bubble.

In navigation bar

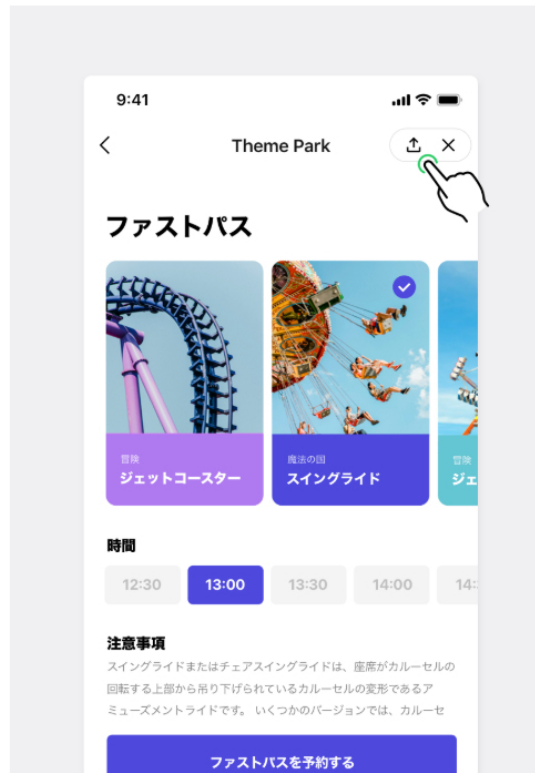

Share the entire page through a share button located in the top navigation.

In App Browser (IAB)

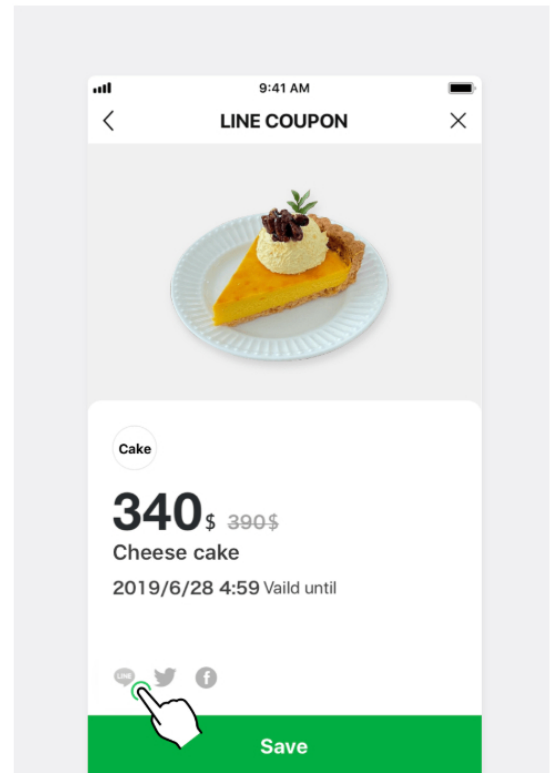

MINI App

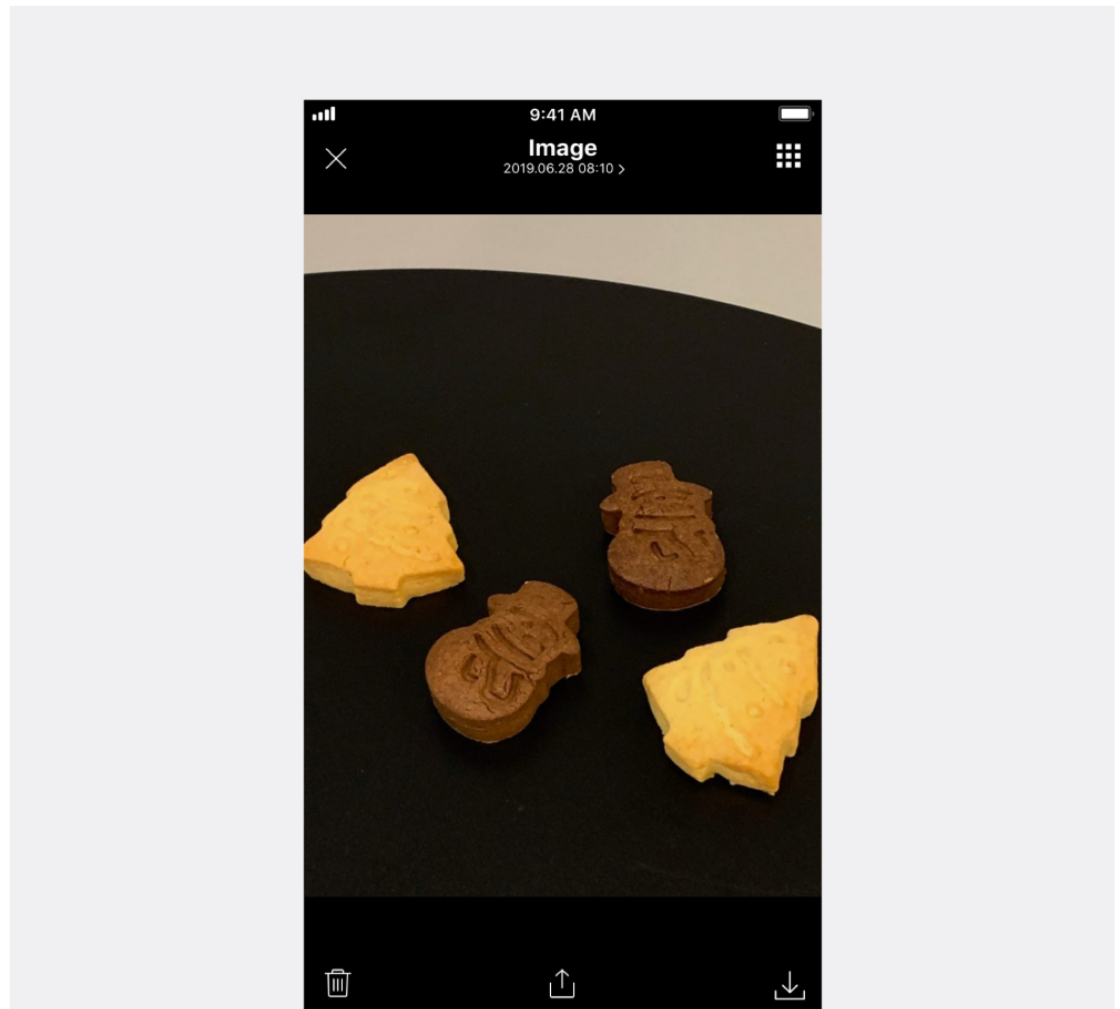

in MINI App, share the entire page through the share button located in the top navigation.

SNS list buttons

The selected content can be shared to each SNS through the SNS Share button located at the bottom of the content.

In viewer bottom

When providing sharing in the viewer, the primary action is often located in the upper right area, thus in most cases a share button should be placed at the bottom.

The order of placement is as follows:

Do

If only a share and a save button are required, place them as above.
Place the share on the left and save on the right.

Do

If Delete, share, and save are required, place as above.
Place the delete on the left and the save on the right.

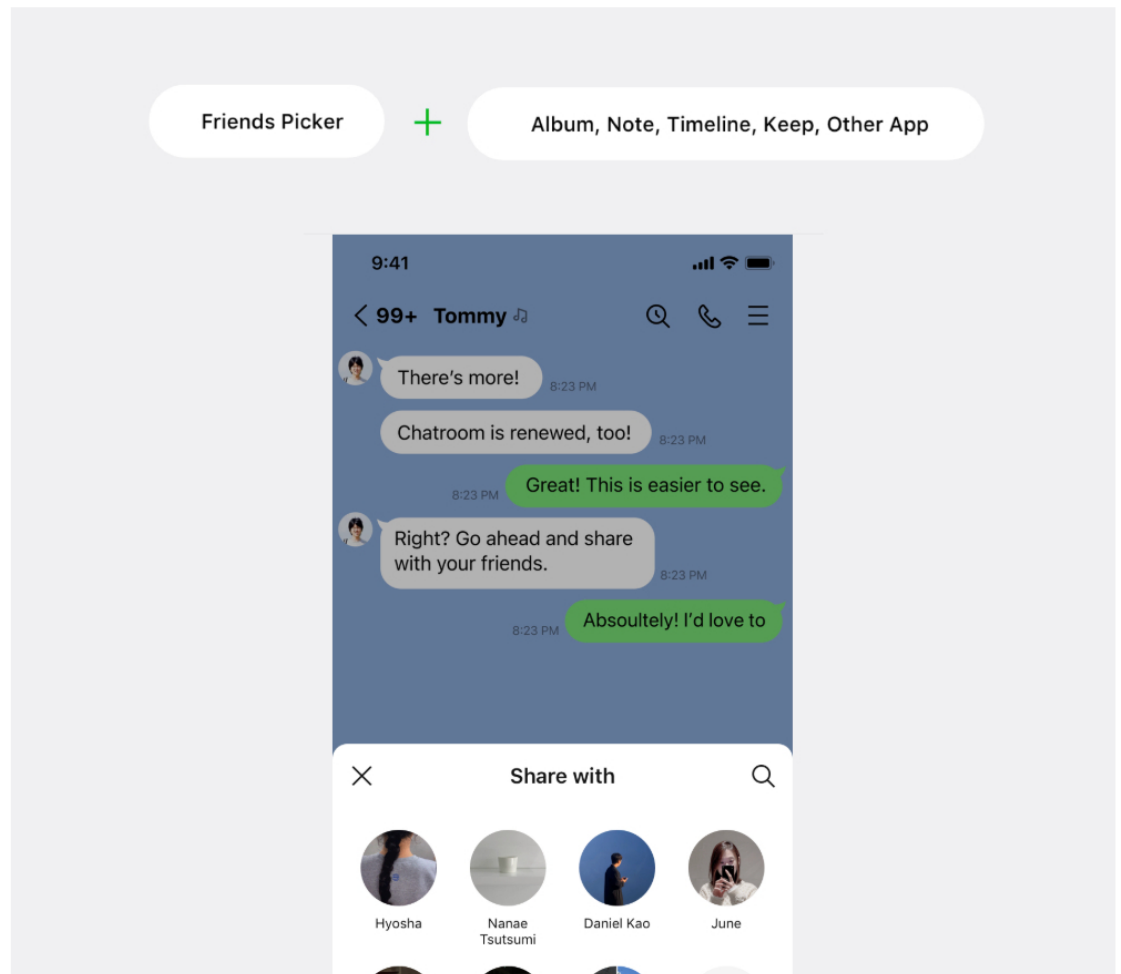

Do

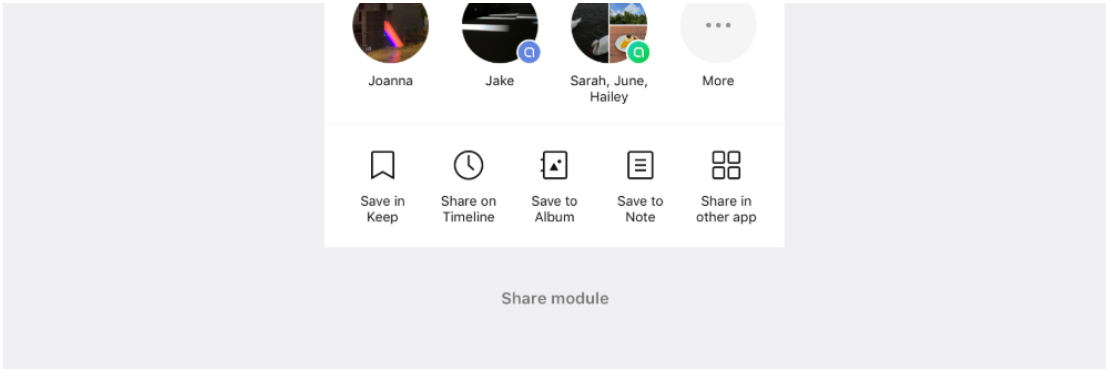

In the bottom area of the viewer, up to four buttons can be placed. Place delete on the left and save, share on the right.

Share module

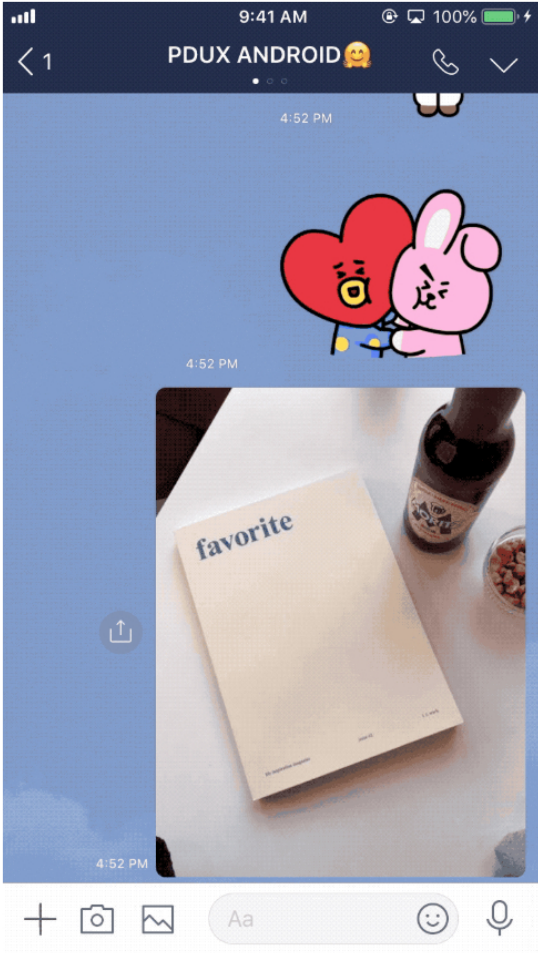

When the user clicks the Share Icon, they will be presented with a screen to select and share.

This UI currently known as the "Friends picker" in the existing LINE app, will also be implemented in the 'Share module' through the current improvement project. The big difference will be that it offers a half modal view and allows users to share more by providing a friends list and combined LINE services in the one interface.

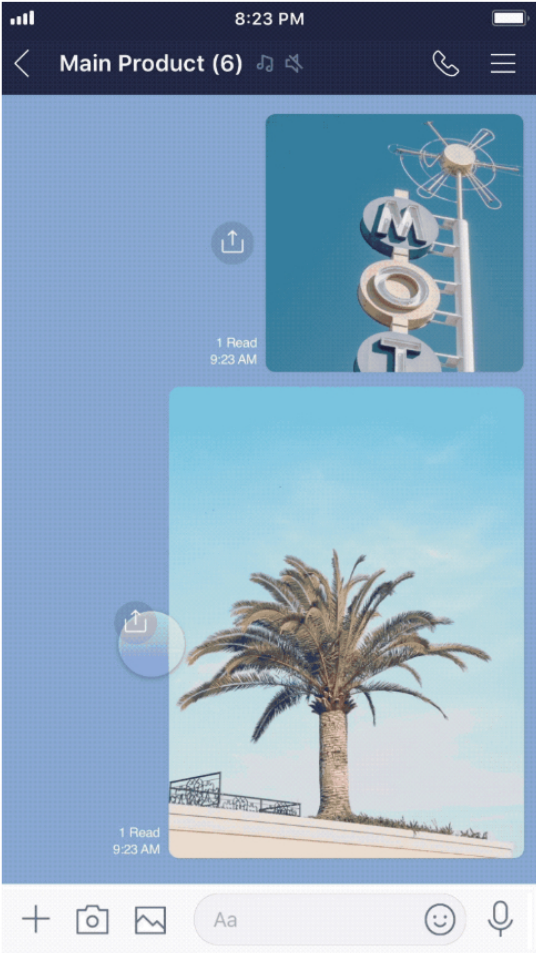

Friends picker (Current)

The existing sharing module Friends Picker has problems and a relatively long sharing process. Different sharing methods are provided depending on the service, and it does not cover all services.

Share module (TO-BE)

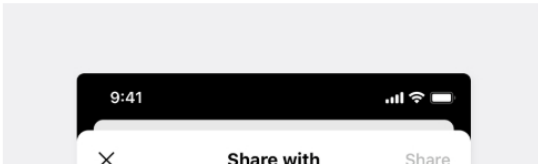

The new sharing module is implemented in half modal form to maintain chat room context at the time of sharing and encourage users to use the sharing function more freely.

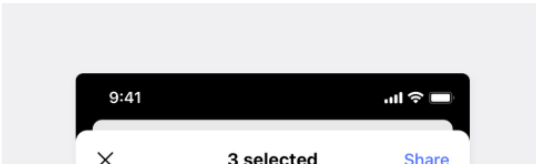

Search / Message Input

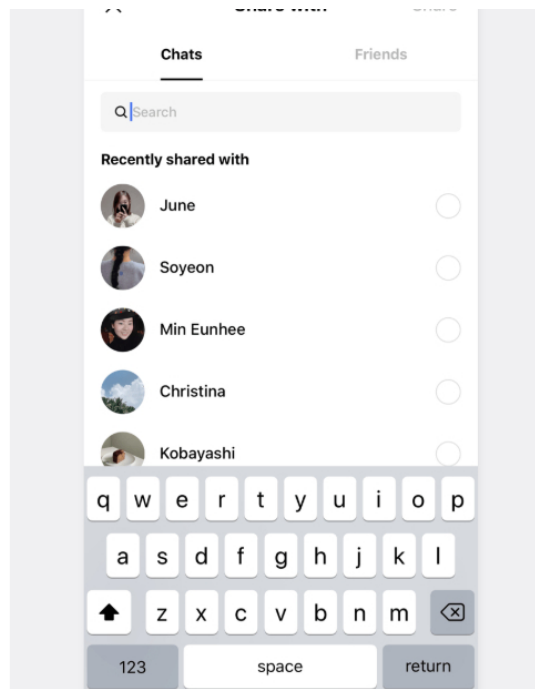

Combines the search function as per the existing friends picker functionality and the message input function.

Search

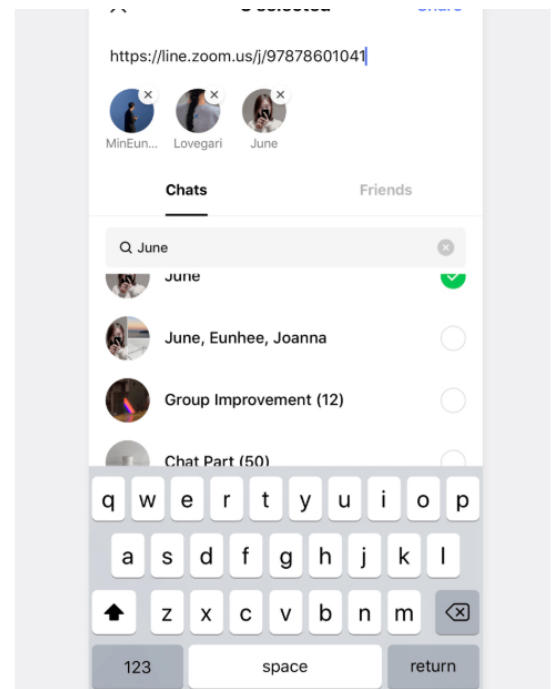

Message input

Uses only the essential parts of the existing friends picker search and provides search UX optimized for half modal type.

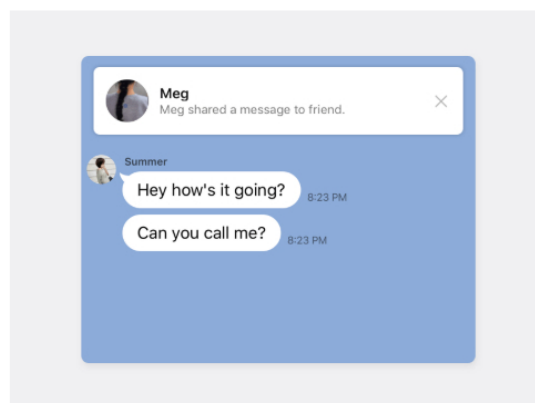

Provides a message input window to send a simple message with the contents you are sharing.

Share feedback

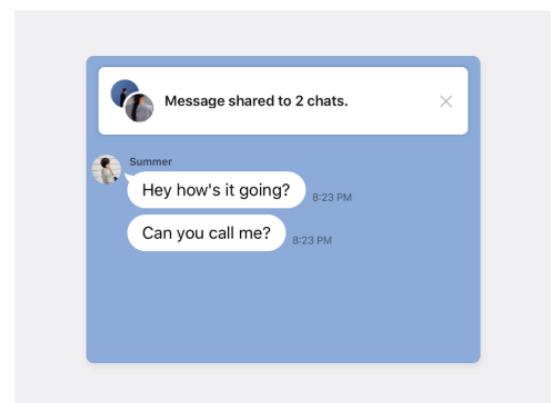

Previously, inconsistent feedback was being provided when users share contents.

From now on when the share process is complete in LINE, the display will always remain on the current screen.

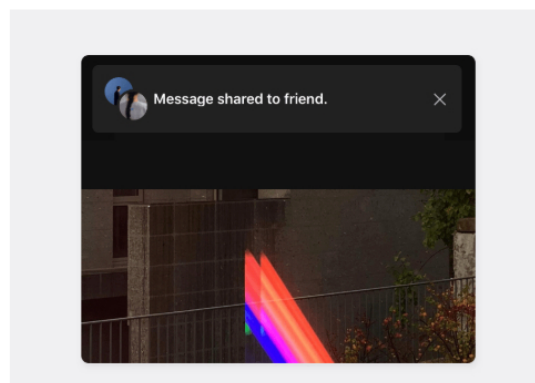

However, if there is a need to enter a shared screen, the Snackbar feedback component can provide an entry path to the shared object.

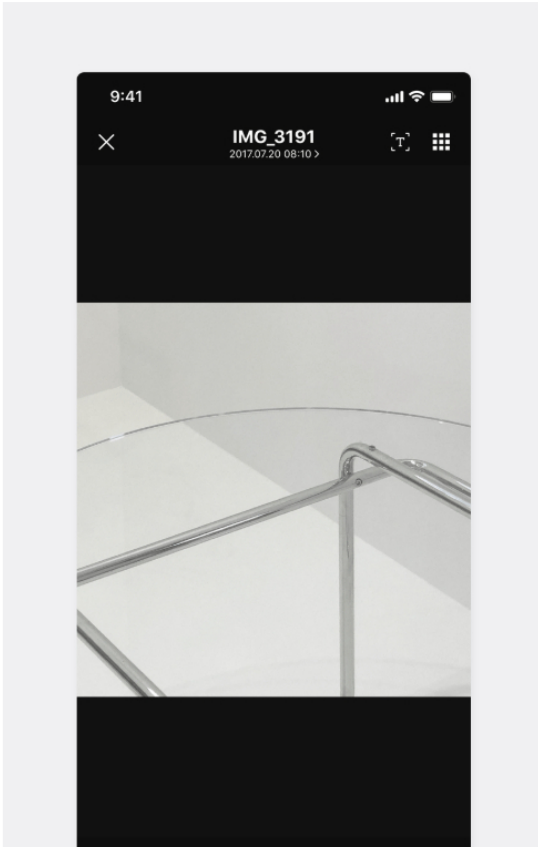

Exposure to top navigation bar area

Share to more than one person

Share on the viewer screen

Provide toast overlay if user shares to other apps.
