# Tabs

Tabs are used to organize content by grouping similar information within a page.

## Anatomy

### 1. Text area

This is the area to display content of the tab on a single row.

You can highlight the selected tab using bold, color, etc.

### 2. Border area (Optional)

Display the boundary between the tab item and content below it.

### 3. Selected border

You can apply different colors for the distinction of active tab and inactive tab.

### 4. Badge area (Optional)

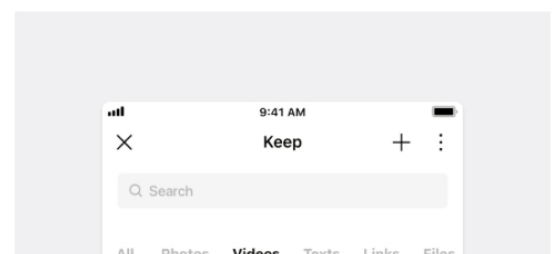

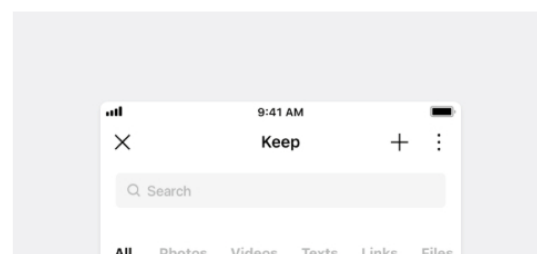

This is the area to display badges if there is a new content in the tab.

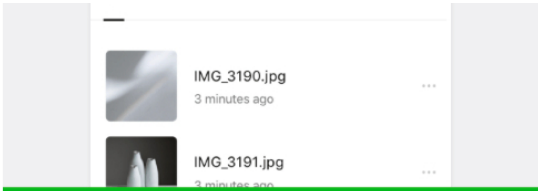

### 5. Background area (Optional)

This is an area to display the selected tab by highlighting the background color in the box type.

### 6. Tab Item

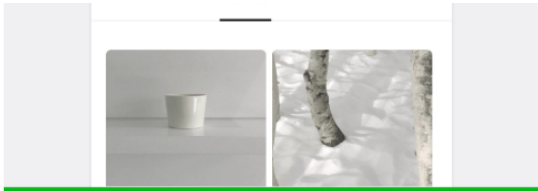

This is the tab area configured as one.

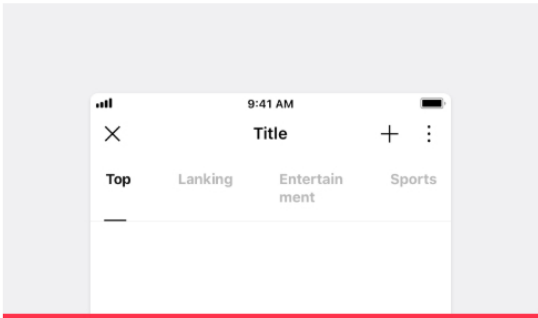

### Do

Support horizontal scrolling within the tab if the entire tab does not fit into one screen.

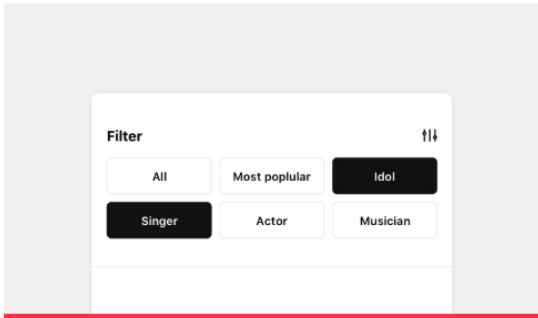

### Do

Apply underlining and changed color on text and icons of the active tab for the distinction between active tab and inactive tab.

### Don't

Use scrollable tab without displaying long text by changing the lines.

### Don't

Only one tab can be activated at once.

## States

Selected

Item

Item

The tab is selected and active.

Unselected

Item

Item

The tab is not selected.

Pressed

Item

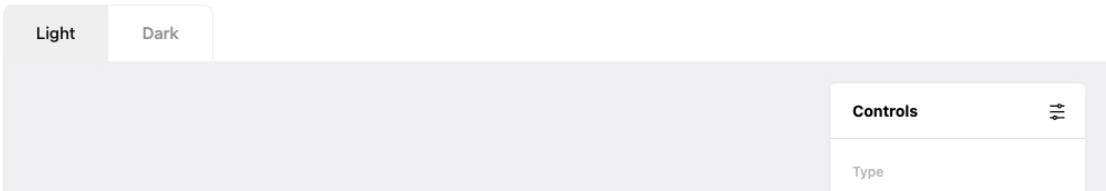

Item

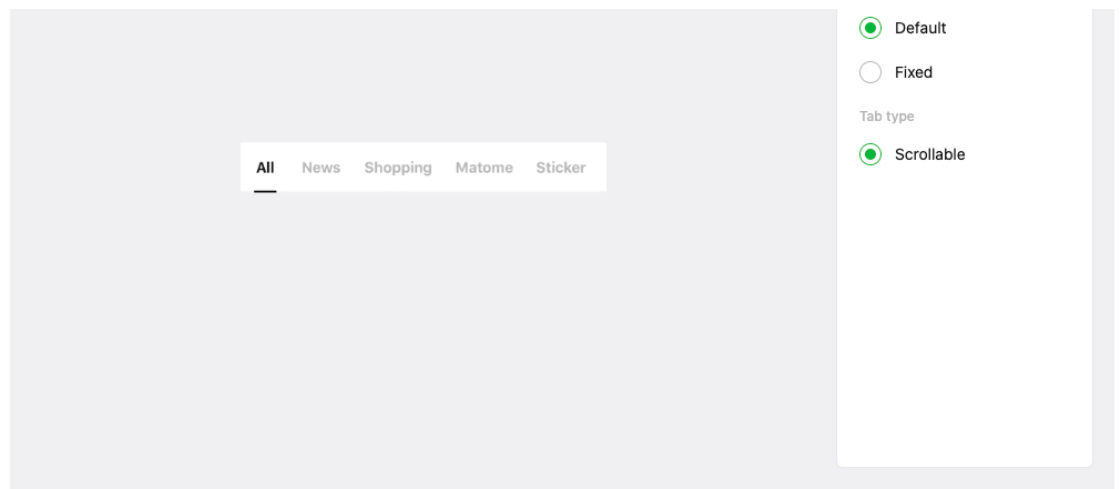

User pressing the tab.

## Types

Classified into text type, box type, and icon type, depending on the tab component.

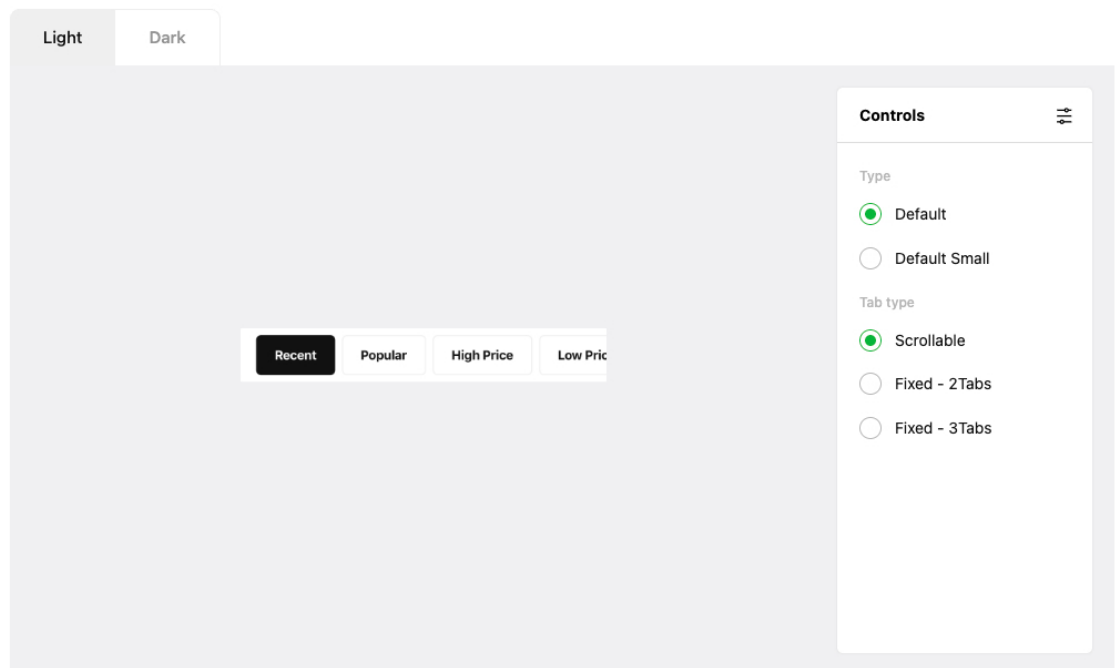

### Text Type

- Text type is a basic type of tab. It is most widely used in general.

## Box Type

- The box type is used when trying to divide content for the filtering purpose.
- Longer text labels and more tabs can be used because the scrollable tab is displayed without a fixed width.
- In case of the fixed tab, all tabs are displayed on one screen and each tab is displayed with a fixed width. It is not scrolled in order to display more tabs. The visible set of tabs indicate the only tabs available.
- The width of each fixed tab is determined by dividing the screen width by the number of tabs. Use of 2, 3, and up to 4 columns is recommended.

## Interaction

### Select a tab

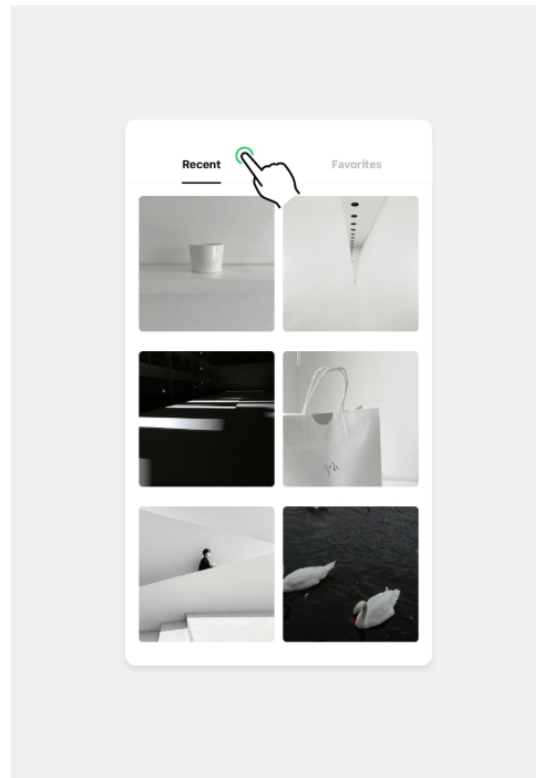

Users can navigate between tabs by pressing the tab or swiping the content.

If the List and the Tab each contain a swipe gesture simultaneously, the one in the existing List gets the priority.

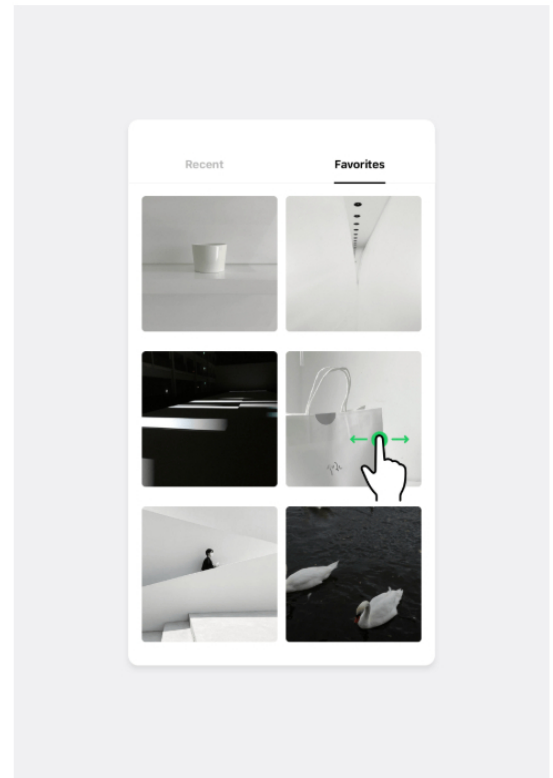

⚠ The List that LINE Messenger uses to control items through swipe gestures is as follows :

🗨 Chat list

- ⊙ Chat list
- ⊙ Friends list
- ⊙ Chat & Friends list on search results

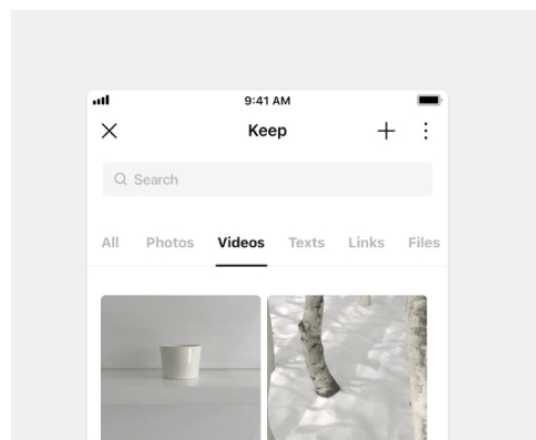

You can navigate by pressing the tab.

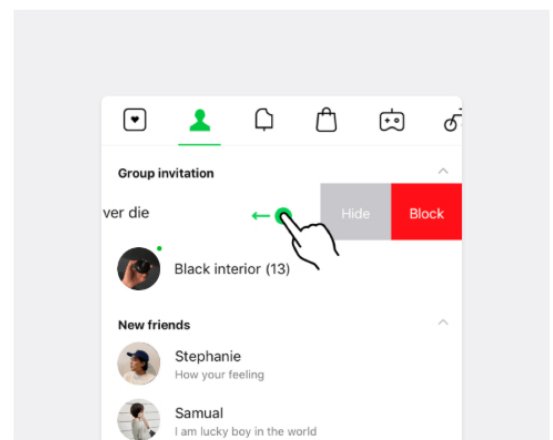

Users can swipe left or right inside the content area to move between tabs.

## Do & Don't

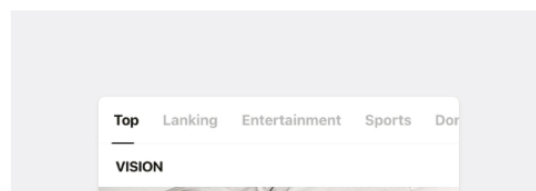

### Do

When a tab is selected, the location is changed to fully show the active tab on the screen.

### Don't

Do not place the swipeable item on the entire UI content area of the tab because users may swipe the wrong component by mistake.

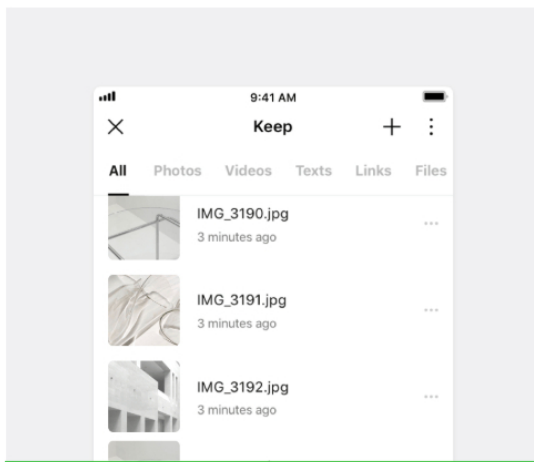

### Caution

Take precaution with the collision of gesture when you place a different swipeable item (e.g. Card, List) in the content area.

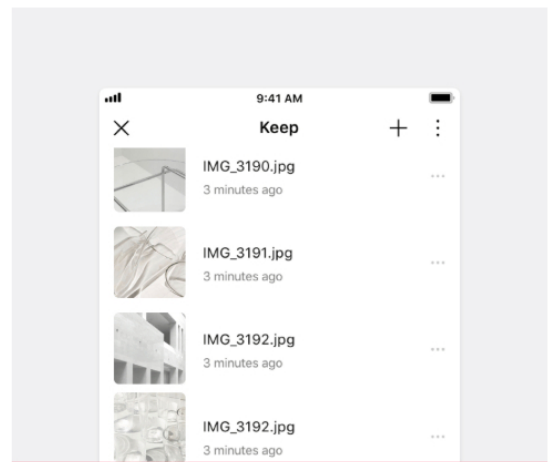

## Scrolling

You can fix the tab on the screen or make it scroll if the screen is scrollable. After being scrolled on the screen, it returns if the user scrolls the other way.

### Do

If the tab is connected right below the top navigation, the tab can be scrolled and fixed to the top of the screen.

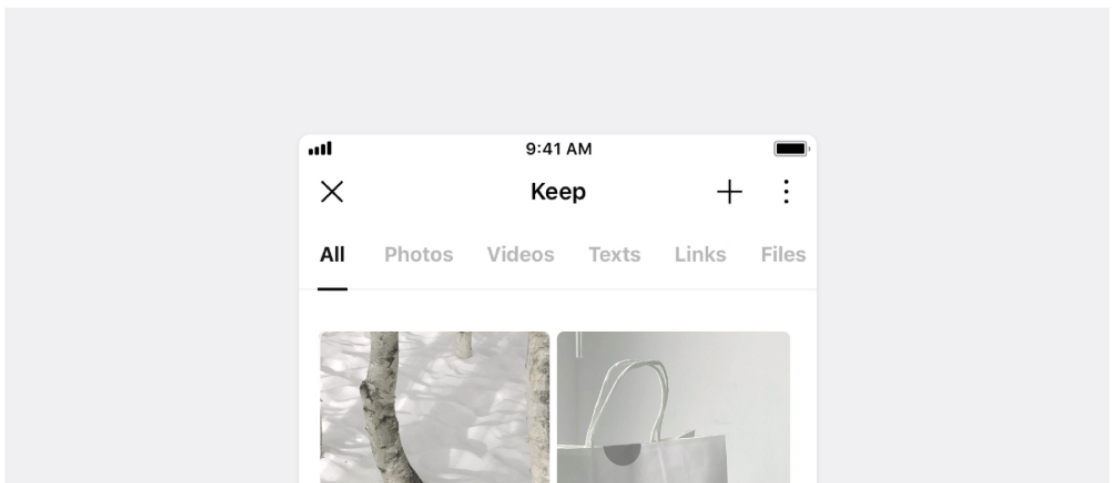

### Don't

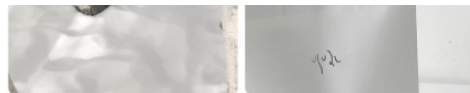

Do not hide the tab underneath Top Navigation. Once the tab is connected to the component, it must be movable and appear as a single unit.

## Usage

### General Usage

In general, this is used in the following manner

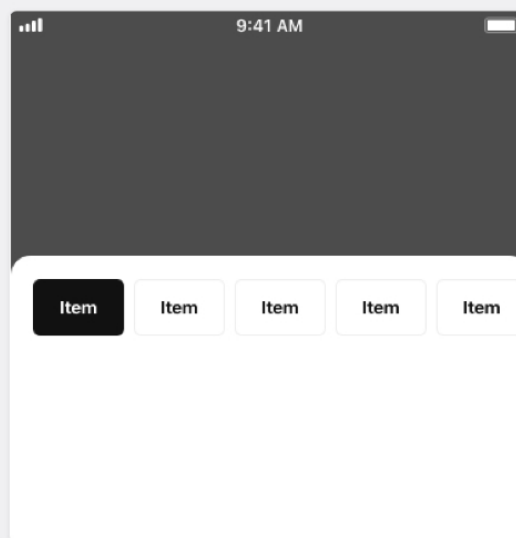

Place below the top navigation to let users see by grouping all content.

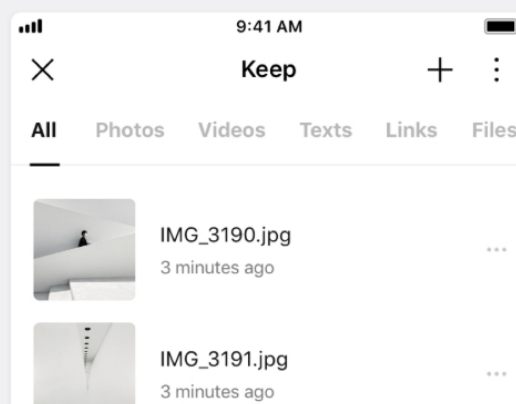

## Bottom Sheets Usage

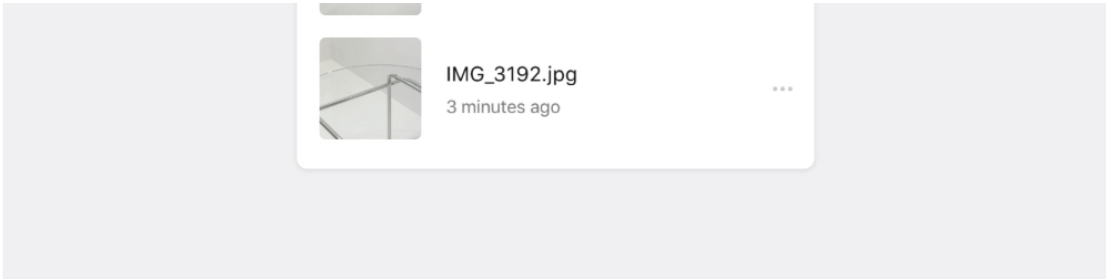

In the bottom sheets component, it is used in the following manner

Place on the bottom sheets header to let users see by grouping all content.

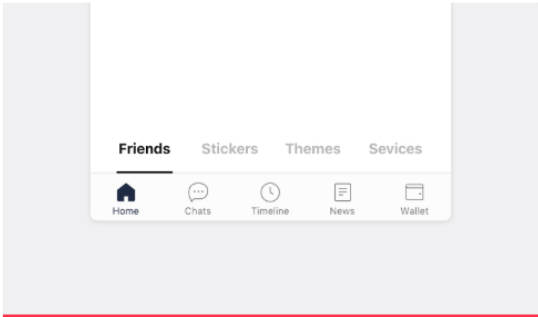

## Placement & Layout

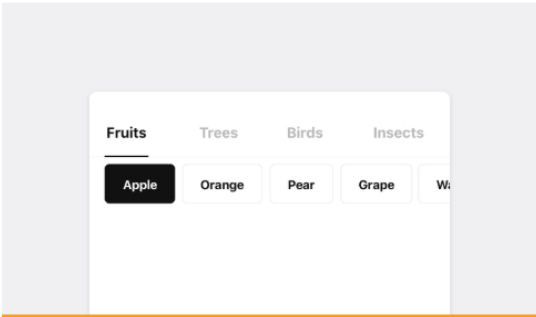

**Placement** Place at the top of the content dependent on the tab, and at the bottom of the top navigation.

**Design Guide** Tabs are displayed as a single row.

### Don't

If the tab is connected to the bottom navigation, it can be confusing as to which action or content the tab is controlling.

### Caution

Avoid using an overlapping tab inside another tab.
